ABOUT THIS AIF

This annual information form (AIF) provides important information about Lundin Gold Inc. (Lundin Gold or the Company) and its business.

This AIF has been prepared in accordance with Canadian securities laws. It describes the Company’s history and its business, its estimates of mineral reserves and resources, the regulatory environment in which it carries on business, the risks the Company faces, the market for its shares and its governance, among other things.

This AIF is dated March 24, 2020. Unless stated otherwise, all the information in this AIF is stated as at December 31, 2019.

This AIF incorporates by reference:
- Lundin Gold’s management’s discussion and analysis for the year ended December 31, 2019 (2019 MD&A), which is available under the Company’s profile on the SEDAR website at www.sedar.com (SEDAR); and
- Lundin Gold’s audited consolidated financial statements for the year ended December 31, 2019 (2019 Financial Statements), which are available on SEDAR.

FINANCIAL INFORMATION

Unless otherwise specified, all dollar amounts referred to in this AIF are stated in United States dollars. References to CAD$ mean Canadian dollars.

Financial information is presented in accordance with International Financial Reporting Standards as is issued by the International Accounting Standards Board, unless otherwise stated.

CAUTION ABOUT FORWARD-LOOKING INFORMATION

This AIF and the documents incorporated by reference include statements and information about management’s expectations for the future. When discussing strategy, plans and future financial and operating performance or other things that have not yet taken place, management is making statements considered to be forward-looking information or forward-looking statements under Canadian securities laws. They are referred to in this AIF as forward-looking statements.

Forward-looking statements in this AIF:
- typically include words and phrases about the future, such as believe, estimate, anticipate, expect, plan, intend, predict, goal, target, forecast, project, scheduled, potential, strategy and proposed; and
- are based on opinions, assumptions, estimates and expectations of management as of the date such statements are made, and they are subject to known and unknown risks, uncertainties and other factors which may cause the actual results, performance or achievements of the Company to be materially different from any future results, performance or achievement expressed or implied by such forward-looking statements.

Examples of Forward-Looking Statements

Examples of forward-looking statements included in this AIF are statements relating to:
• the impact of the suspension of the Company’s operations
• the Company’s efforts to minimize the impacts of the suspension of operations
• the timing of the resumption of operations at Fruta del Norte
• anticipated annual average production and mine life
• benefits to be derived from its updated mine plan
• estimates of operating costs and expenditures and requirements and economic returns
• estimates of capital expenditures and all-in sustaining cost
• the benefits to be derived under the EA and the IPA (defined below)
• expectations relating to the receipt of regulatory approvals, permits and licenses under governmental and regulatory regimes
• the Company’s liquidity and potential need and availability of future sources of financing
• the political and economic environments in Ecuador
• exploration plans, exploration and development expenditures
• reclamation and closure costs
• royalty and tax payments and rates
• cash flows and their uses
• the Company’s drill results, geology and mineral resource and mineral reserve estimates and metallurgical recoveries.

Statements relating to "mineral resources" are deemed to be forward-looking information, as they involve the implied assessment, based on certain estimates and assumptions that the mineral resources described can be profitably produced in the future.

Material Risks

Lundin Gold’s future actual results could differ materially from those anticipated. The Company has established a process for identifying, assessing and managing risks that could affect its operations and the value of the Company’s common shares (the Shares). The following risk factors could cause actual results to differ materially from those projected in the forward-looking statements:

• risks relating to the impacts of a pandemic virus outbreak
• risks associated with the Company’s community relationships
• risks related to financing requirements
• failure to maintain its obligations under the Orion Bx Financing or the Senior Facility (defined below) and other debt
• operating risks, including risks related to a temporary suspension of operations
• risks associated with ramp up of mining operations
• risks related to political and economic instability in Ecuador
• risk related to production estimates
• risks related to Lundin Gold’s compliance with environmental laws and liability for environmental contamination
• volatility in the price of gold
• shortages of critical supplies
• lack of availability of infrastructure
• deficient or vulnerable title to mining concessions, easements and surface rights
• risks related to the Company’s workforce and its labour relations
• inherent safety hazards and risk to the health and safety of the Company’s employees and contractors
• risks related to the Company’s ability to obtain, maintain or renew regulatory approvals, permits and licenses,
• the imprecision of mineral reserve and resource estimates,
• key talent recruitment and retention of key personnel,
• volatility in the market price of the Shares
• the potential influence of the Company’s largest shareholders
• uncertainty with the tax regime in Ecuador
• measures to protect endangered species and critical habitats
• the cost of non-compliance and compliance costs
• exploration and development risks
• the Company’s reliance on one project
• risks related to illegal mining
• the reliance of the Company on its information systems and the risk of cyber-attacks on those systems
• the adequacy of the Company’s insurance
• uncertainty as to reclamation and decommissioning
• the ability of Lundin Gold to ensure compliance with anti-bribery and anti-corruption laws
• the uncertainty regarding risks posed by climate change
• the potential for litigation
• limits of disclosure and internal controls
• security risks to the Company, its assets and its personnel
• conflicts of interest
• risks that the Company will not declare dividends
• social media and reputation

Many of these uncertainties and contingencies can affect the Company’s actual results and could cause actual results to differ materially from those expressed or implied in any forward-looking statements made by, or on behalf of, the Company. The risk factors listed above are discussed in more detail later in this AIF in the section entitled “Risks Factors”.

The Company believes that the expectations reflected in this forward-looking information are reasonable as of the date of this AIF, but no assurance can be given that these expectations will prove to be correct. Readers are cautioned not to place undue reliance on forward-looking statements, and the Company disclaims any obligation to update or revise forward-looking statements if circumstances or management’s beliefs, expectations, or opinions should change, except as required by law.

A Note for US Investors Regarding Estimates of Measured, Indicated and Inferred Mineral Resources

This AIF uses the terms “measured”, “indicated” and “inferred” mineral resources. United States investors are advised that while such terms are recognized and required by Canadian regulations, the United States Securities and Exchange Commission does not recognize them. “Inferred mineral resources” have a great amount of uncertainty as to their existence, and as to their economic and legal feasibility. It cannot be assumed that all or any part of an inferred mineral resource will ever be upgraded to a higher category. Under Canadian rules, estimates of inferred mineral resources may not form the basis of feasibility or other economic studies. United States investors are cautioned not to assume that all or any part of an inferred mineral resource exists or is economically or legally mineable.
ABOUT LUNDIN GOLD

Lundin Gold Inc. (the Company) is a Canadian mining company with its head office located in Vancouver, British Columbia. The Company owns the Fruta del Norte Project (the Project, Fruta del Norte or FDN) located in southeast Ecuador. Fruta del Norte is among the largest and highest-grade gold projects in the world, which is now in production.

The Company’s board and management team have extensive expertise in finance, mergers and acquisitions and mine operations and are dedicated to advancing Fruta del Norte responsibly and creating shareholder value. The Company operates with transparency and in accordance with international best practices. Lundin Gold is committed to delivering value to its shareholders, while simultaneously providing economic and social benefits to impacted communities, fostering a healthy and safe workplace and minimizing the environmental impact. The Company believes that the value created through Fruta del Norte will benefit its shareholders, the Government and the people of Ecuador. Lundin Gold’s website address is www.lundingold.com.

THE COMPANY’S STRUCTURE

Lundin Gold conducts its business activities through various subsidiaries. The Project Subsidiaries are those entities in Canada and Ecuador whose business purpose is related to Fruta del Norte. The Non-Project Subsidiaries are related to Lundin Gold’s exploration activities.

The Project Subsidiaries:

- Aurelian Ecuador S.A. (AESA), which holds the concessions underlying the Fruta del Norte Project in Ecuador, is the Company’s major operating subsidiary. It is wholly owned by Lundin Gold through Aurelian Resources Inc. and Aurelian Resources Corporation Ltd., which are both Canadian subsidiaries.

- Condor Finance Corp. (Condor) is a Canadian wholly owned subsidiary of Lundin Gold. Condor’s principal purpose is to provide lending, working capital and financial services to the Company’s subsidiaries.

- Ecoaurelian Agricola S.A., which owns certain land rights related to the Fruta del Norte Project, is a subsidiary of Aurelian Ecuador Holding S.A. and AESA.

The Non-Project Subsidiaries:

- Aurelianmenor S.A. (AMSA) holds eighteen of the Company’s exploration concessions. It is wholly owned by Lundin Gold through Aurelian Exploration Inc. and Aurelian Menor Inc., which are both Canadian subsidiaries of the Company.
Surnorte S.A. (Surnorte) was formed in 2019, and it holds eight exploration concessions. Surnorte is a subsidiary of two Singaporean holding companies, Surnorte Holdings I Pte. Ltd. and Surnorte Holdings II Pte. Ltd. These two holding companies are in turn owned by Surnorte Venture Pte. Ltd., a joint venture company established under an earn-in agreement with Newcrest Mining Limited (Newcrest). Pursuant to the earn-in agreement described in detail in this AIF, Newcrest can earn up to a 50% interest in Surnorte Ventures Pte. Ltd.

The following diagram depicts the corporate structure of Lundin Gold and its subsidiaries as at December 31, 2019, including the name, jurisdiction of incorporation and proportion of ownership interest in each.

Lundin Gold is a reporting issuer in all of the provinces and territories of Canada other than Québec. The Shares are listed on the Toronto Stock Exchange (the TSX) and on NASDAQ Stockholm under the symbol “LUG”. The Vancouver office of Computershare Investor Services Inc. acts as the registrar and transfer agent for the Shares. The address for Computershare is 510 Burrard Street, 3rd Floor, Vancouver, B.C. V6C 3B9, and the telephone number is 1-800-564-6253. The registered and records office of Lundin Gold is located at Blake, Cassels & Graydon LLP, Suite 2600, 595 Burrard Street, Vancouver, British Columbia V7X 1L3.

THE COMPANY’S DEVELOPMENT

The Company was incorporated in British Columbia as Fortress Resources Inc. in 1987 and in 2002 was continued under the Canada Business Corporations Act. In 2004, the Company changed its name to Fortress Minerals Corp., was then listed on the TSX Venture Exchange with the trading symbol “FST” and, until 2010, was engaged in precious and base-metal exploration, primarily in Russia, Mongolia and Nicaragua. By 2010, the Company had disposed of its exploration assets. In October 2012, the Company’s listing was transferred to the NEX board of the TSX Venture Exchange (NEX), and the Shares commenced trading under the symbol “FST.H”. The Company’s focus was on finding a strategic opportunity.
In December 2014, the Company acquired Fruta del Norte, a major gold development project, from Kinross Gold Corporation (Kinross), along with Kinross’s other concessions in Ecuador. The transaction entailed a name change to Lundin Gold Inc., an equity financing, a graduation from NEX to the TSX and a listing on NASDAQ Stockholm under the symbol “LUG”.

In 2016, the Company announced the results of an independent feasibility study for the Fruta del Norte Project and filed a technical report prepared in accordance with National Instrument 43-101 - Standards of Disclosure for Mineral Projects, Companion Policy 43-101CP and Form 43-101F of the Canadian Securities Administrators (NI 43-101) and entitled “Fruta del Norte Project Ecuador NI 43-101 Technical Report on Feasibility Study” dated June 15, 2016 with an effective date of April 30, 2016 (the Technical Report). The Technical Report was prepared by Amec Foster Wheeler Americas Limited (Amec Foster Wheeler), with the support of four other globally recognized, leading engineering firms. The feasibility study confirmed that FDN could support an economically viable and robust, high grade underground gold mine. The feasibility study is discussed later in this AIF under the heading “The FDN Project Technical Report Summary”.

In 2016, the two significant milestones allowed the Company to commence development of FDN. First, the Government of Ecuador (GOE) approved the environmental impact assessment (the EIA) for the Fruta del Norte Project and then granted the related environmental license (the Environmental Licence).

Second, the Company successfully negotiated and entered into two key mining conventions with the GOE, the Exploitation Agreement (the EA) and the Investment Protection Agreement (the IPA), which established the fiscal, operation and commercial terms and conditions for the development and operation of FDN. Both the EA and the IPA are publicly available on the Company’s profile on SEDAR. The key terms of the EA and the IPA are summarized below in the section entitled “Material Contracts”.

From 2017 to 2019, the Company’s Project team focussed on the development of FDN, which included construction at the mine site and building the transmission line required to connect FDN to the national power grid. Over the same period, the Company secured the necessary financing, through both equity and debt, sufficient to fund the development of the Project.

By the end of 2019, the Company had met its objective of achieving first gold production at FDN and had commenced the export of both gold concentrate and doré. In the first quarter of 2020, FDN achieved commercial production. However, operations were suspended on March 22, 2020 due to the impacts of global COVID 19 pandemic in Ecuador. As at the date of this AIF, operations at FDN were still suspended.

THREE YEAR HISTORY

Over the three most recently completed financial years, the significant events below contributed to the development of the Company’s business.

2017

Project Status: Having received the Environmental License and signed the EA, the Company commenced the development of FDN. During the year, work on the Fruta del Norte Project progressed across all areas, including completion of basic engineering and start of detailed engineering, procurement, underground development, civil earthworks and surface construction. By year end, mine development transitioned from soft tunneling to hard rock development in both tunnels to access the orebody.

In January 2017, Lundin Gold obtained a $35 million short-term credit facility (2017 Zebra Loan) from Zebra Holdings and Investments S.à.r.l. (Zebra), a company owned by a trust whose settlor was the late Adolf H. Lundin (the Lundin Family Trust). An aggregate of 247,867 Shares was issued to Zebra pursuant to the 2017 Zebra Loan, in lieu of fees and interest. The proceeds from the 2017 Zebra Loan were used for the ongoing initial work programs (the Early
Works) and for general corporate purposes. All amounts outstanding under the 2017 Zebra Loan were repaid in full in July 2017 from the proceeds of the Orion Bx Financing (as defined below).

In May 2017, the Company completed a project update, the Project Progress Report (the PPR), which advanced the design and estimates from the Feasibility Study. The PPR included a revised mine plan, updated capital and life of mine operating costs and a new execution plan based on a self-perform approach versus engineering, procurement and construction management (EPCM).

On May 30, 2017, the Company secured a project finance package (the Orion Bx Financing) with the Orion Mine Finance Group (Orion) and Blackstone Tactical Opportunities (Blackstone). The Orion Bx Financing is comprised of a gold prepay credit facility for $150 million (the Prepay Loan), a stream loan credit facility of $150 million (the Stream Loan), an offtake agreement and participation of $100 to $150 million to future equity financings. The Prepay and Stream Loans are secured by way of a charge over the Project Subsidiaries’ assets, pledges of the shares of the Project Subsidiaries and guarantees of the Company and the Project Subsidiaries. The full amount of the Prepay and Stream Loans was drawn by early 2018. Orion’s participation in equity financings was satisfied under the Private Placement described below.

On July 1, 2017, the Fruta del Norte Project began its transition from the Early Works phase into the Project Execution phase. During the Fall of 2017, the Company awarded long-lead time processing plant equipment and detailed engineering contracts for the process plant, tailings facility and water management. Lundin Gold also awarded an engineering, procurement and construction contract for the power transmission line from the Bomboiza substation to the Fruta del Norte Project.

In November, the Company was recognized by the United Nations Global Compact Networks of Columbia and Ecuador at the Best Practice Awards for Sustainable Development for its work undertaken jointly with the Lundin Foundation and Catering Las Peñas, the supplier of food preparation, cleaning and laundry services to FDN.

2018

Project Status: Progress continued on the Project in all areas of engineering, procurement and construction. The Company obtained the powerline environmental license, obtained requisite access rights from all landowners and made significant progress on the 42 km powerline connecting the Project to the national grid and executed the Cooperation Agreement for the Taday to Bomboiza powerline and substation with the national electricity regulator, La Corporación Eléctrica del Ecuador. In November, the Company received the Mountain Pass Quarry environmental license and in late December executed a mining exploitation agreement with the Parish GAD (Gobierno Autonomo Descentralizado) of the Municipality of Yantzaza (the Quarry Exploitation Agreement), which sets out the terms under which royalties relating to the quarry production of rock and aggregate required for FDN site construction are payable.

In February, the Company announced a $400 million equity private placement financing (the Private Placement), at a weighted average subscription price of CAD$5.44 per Share. Subscribers to the Private Placement included: (i) Newcrest Canada Inc., an affiliate of Newcrest; (ii) Orion, through its affiliate Orion Co-V Holdings Pte Ltd.; (iii) Zebra and Lorito Holdings S.à.r.l. (Lorito), companies owned by the Lundin Family Trust.

Because Newcrest would hold greater than 20% of the issued and outstanding Shares and would become the largest shareholder of the Company upon the closing of the Private Placement, under TSX rules the Private Placement materially affected control of the Company and therefore required shareholder approval. The Company obtained such approval through the solicitation of written consents in a form acceptable to the TSX. The threshold for approval by way of consent was approval by beneficial shareholders owning, in the aggregate, more than 50% of the outstanding Shares.
At the same time as the Private Placement, the Company announced that it had signed a binding heads of agreement with Newcrest to form a joint venture company to explore eight early stage concessions then held by Lundin Gold’s subsidiary, AMSA. Newcrest can earn up to a 50% interest in the joint venture company by spending $20 million over a five-year period. Newcrest is the operator of the joint venture. The parties subsequently executed a definitive earn-in agreement on November 5, 2018 (the Newcrest Earn-In Agreement). See “Mineral Exploration”.

On March 26, 2018, Lundin Gold closed the Private Placement. Pursuant to the Private Placement, Newcrest invested $250 million and the Lundin Family Trust, through Zebra and Lorito, invested $50 million, at a price of CAD$5.50 ($4.33 at a CAD/USD foreign exchange of 1.27) per Share. Orion invested $100 million at a price of CAD$5.25 ($4.13) per Share. Upon closing, the Company issued 93,497,140 Shares and Newcrest owned 27.1% of the Company’s outstanding Shares; the Lundin Family Trust owned 22.3%; and Orion owned 11.4%.

Both Newcrest and Orion have Board representation rights tied to their ownership position. The Board of Directors appointed Orion’s nominee, Istvan Zollei, as a director on March 26, 2018. Newcrest’s nominees, Michael Nossal and Craig Jones, were elected to the Board at the Company’s Annual General Meeting of Shareholders on June 1, 2018.

On July 6, 2018, Lundin Gold closed a senior secured project finance facility of $350 million to fund the balance of the development and construction of the Project (the Senior Facility) with a syndicate of seven lenders (the Senior Lenders) including: ING Capital LLC, Societe Generale, Caterpillar Financial Services Limited, the Bank of Nova Scotia, Natixis, KfW IPEX-Bank GmbH and the Bank of Montreal. The Senior Facility includes two tranches: Tranche A ($250 million), and Tranche B ($100 million) with an 8-year term for both facilities. The Senior Facility is secured by way of a first charge over the Project Subsidiaries’ assets, pledges of the shares of the Project Subsidiaries and guarantees of Lundin Gold and the Project Subsidiaries. Tranche A is also secured by a guarantee from Finnvera, an export development agency owned by the Government of Finland.

At the same time, the Company also announced that it had executed its first offtake agreement for approximately half of its gold concentrate production over its first eight years of operations with Boliden S.A., a company with a network of mines and smelters across Europe.

In September, the Company completed an update of the project estimate (UPE). The UPE resulted in increases in the Project’s NPV 5% ($786 million from $717 million) and IRR (17.5% from 16.3%) compared to the previously released PPR. The new capital cost estimate increased only marginally by $8.0 million to $692 million (inclusive of contingency and pre-production expenses and revenues and net of taxes). At the same time, the life-of-mine (LOM), estimated all-in sustaining costs (AISC) dropped to $583 per ounce of gold from $609 per ounce of gold.

2019

Project Status: Over the course of 2019, the development of the Fruta del Norte Project continued on budget and on schedule. At the start of the year, the underground mine declines reached the orebody, and level development began. By June, the Company had begun mining its first production stope at FDN. In October, the Company’s powerline to the Project was energized, providing the Project with energy from Ecuador’s national power grid. By the end of 2019, the Company had met its objective of achieving first gold production.

On February 20, the Company entered into an agreement with a syndicate of underwriters, pursuant to which the underwriters agreed to purchase, on a bought deal basis, 7,500,000 Shares of the Company at a price of CAD$5.40 per Share, for aggregate gross proceeds of CAD$40,500,000 (the 2019 Equity Financing). The Company also granted the underwriters a 15% over-allotment option. On March 1, 2019, the Company closed the 2019 Equity Financing by issuing 8,625,000 Shares of the Company for gross proceeds to the Company of CAD$46,575,000, which included the exercise in full of the over-allotment option of an additional 1,125,000 Shares.
At the start of April, the Company completed the first of three draws under the Senior Facility. At the same time, the Company entered into a $75 million cost overrun facility (the COF) with Nemesia S.à.r.l. (Nemesia), a company owned by the Lundin Family Trust. The COF is available once the Senior Facility is fully drawn and can only be used to fund a potential cost overrun related to the Project. To date, the Senior Facility is fully drawn, but the Company has not drawn any amount under the COF. In accordance with the terms of the COF, the Company issued Nemesia 300,000 Shares and 300,000 warrants (Warrants) in lieu of fees. Each Warrant has a term of three years from the date of issue and is exercisable for a Share upon payment of the exercise price of CAD$5.98. Lundin Gold is required to issue an additional 300,000 Shares to Nemesia as a condition precedent to the first utilization of the COF.

On August 9, Michael Nossal of Newcrest resigned from the Board and was replaced on the Board by Tamara Brown as Newcrest’s nominee.

On November 13, the Company received the Industrial Water Permit and Administrative Act from La Secretaría Nacional del Agua (SENAGUA) for FDN. These two permits were required in order to move Fruta del Norte into production. At the time, Lundin Gold had started commissioning activities.

In November, the Company, together with the Lundin Foundation, was recognized by the United Nations Global Compact Canada for its contributions to achieving the UN Sustainable Development Goals. This award highlighted the significant positive impacts of the education, training, and local procurement programs associated with FDN. Lundin Gold’s local procurement programs resulted in the purchase of approximately $2.4 million per month in goods and services from the local communities during the year.

On December 5, Lundin Gold’s two largest shareholders increased their interest in the Company through the acquisition of 19,370,216 Shares from Kinross. Newcrest acquired 10,977,502 Shares, resulting in an aggregate holding of 71,470,787 Shares, bringing its interest in the Company from approximately 27% to approximately 32%. Lorito and Zebra together acquired 8,392,714 Shares which, when combined with the holdings of Nemesia, resulted in an aggregate holding by companies controlled by the Lundin Family Trust of 60,114,566 Shares. The acquisition increased Lundin Family Trust’s interest in Lundin Gold from approximately 23% to approximately 27%.

By mid-December, the Company had successfully exported the first shipments of gold concentrate and doré bars from FDN. Eight containers, containing approximately 180 tonnes of concentrate, were shipped from the Port of Guayquil to Boliden’s smelting facility in Harjavalta, Finland. Shortly after, the Company also shipped its first doré bars to a refinery in Switzerland. A total of 28,678 ounces (oz) of gold was produced by the end of 2019.

**Current Year**

On January 9, the Company released the results of its updated LOM plan and AISC estimate (the LOMP). The LOMP resulted in an increase in the projected average annual gold production from 310,000 ozs to 325,000 ozs per year and a reduction in the anticipated LOM from 15 to 14 years. There were no material changes to the estimates of Mineral Resources or Mineral Reserves. The update resulted in a slight increase in forecasted LOM AISC from the UPE estimate of $583/oz to $621/oz of gold, representing a 6.5% or $38 increase. Approximately $26/oz, or 68% of this increase, is due to revised price assumptions for gold ($1,400/oz from $1,250/oz) and silver ($15/oz from $20/oz), which increased estimates of royalties and production taxes and decreased estimates of by-product credits, respectively. See “Fruta del Norte Update”.

On February 20, the Company announced that it had reached commercial production ahead of schedule. In declaring commercial production, management considered a number of factors, including completion of substantially all construction development activities in accordance with design and a production ramp up period which achieved an average throughput of 70% of mill capacity for a period of 90 consecutive days.

Due to growing concerns regarding the spread of COVID-19 in Ecuador and the impacts of increasing efforts by the government at all levels to slow the spread of COVID-19, the Company temporarily suspended operations at FDN on
March 22, 2020. During the suspension, the Company is maintaining a workforce at Fruta del Norte to conduct care and maintenance activities and special projects in order to minimize the impacts of this temporary shutdown. As the situation is dynamic and dependent on actions by both the local and national governments, the Company cannot currently indicate the duration of the temporary suspension on the Company’s operations nor its full impact.

LUNDIN GOLD’S BUSINESS

General Description of the Business

Lundin Gold’s properties in Southeast Ecuador consists of 30 metallic mineral concessions and three materials concessions covering an area of approximately 64,786 hectares. From this, the Fruta del Norte Project is comprised of seven concessions covering an area of approximately 5,566 hectares and is located approximately 140 km east-northeast of the City of Loja in southeastern Ecuador.

Fruta del Norte is among the largest and highest-grade gold projects in the world, which is now in production. For the purposes of NI 43-101, the Company considers Fruta del Norte to be its only material property.

Refer to the Company’s 2019 MD&A available under the Company’s profile on SEDAR for a detailed description of the Company’s business, including each of its operating segments.

• Principal Market and Distribution

The Company produces gold in the form of concentrate and doré bars, which require smelting or refining respectively, to become marketable metal. The Company uses the services of a refiner to refine gold doré. The refined gold is sold to purchasers pursuant to the Offtake Agreement dated as of May 30, 2017 among AESA, Orion and Gryphus Pte Ltd., an affiliate of Blackstone (the Offtake Agreement). See “Material Contracts”. The Company has also entered into agreements with various smelters internationally for the sale of its gold concentrate. Under the Offtake and the agreements with its smelters, the Company’s sales are based on market referenced gold prices in U.S. dollars per ounce during a defined period. Due to the availability of alternative refineries and smelters, the Company is not dependent on the services on any one refiner or smelter.

The gold market is liquid and is traded on a worldwide basis. The primary demand for gold is jewelry fabrication, followed by bullion investment and the technology, industry and dentistry sectors. Demand for and the price of gold is volatile and affected by numerous factors beyond the Company’s control. See “Risk Factors”. The price of gold is generally quoted in US dollars.
• **Specialized Skill and Knowledge**

All aspects of Lundin Gold’s business require specialized skills and knowledge. The Company operates a mine in a remote area of Ecuador, which requires technical expertise in the areas of geology, drilling, mineral resource estimation, mine planning and mineral reserve estimation, engineering, metallurgical processing, mine operations and maintenance, environment compliance, construction, procurement, information technology, community and public relations, regulatory compliance, legal and accounting. In order to attract and retain personnel with such skills and knowledge, the Company maintains competitive remuneration and compensation packages. See “Risk Factors”.

• **Competitive Conditions**

The Company enjoys some competitive advantages over other gold companies in production or late stage development. Fruta del Norte is one of the few multi-million-ounce high grade deposits in production in the world. In addition, Lundin Gold is one of the lower cost gold producers currently in production, based on estimated LOM AISC. Lundin Gold also has an extensive exploration land package in Ecuador in proximity to Fruta del Norte and is poised to commence exploration upon receipt of pending permits.

Nonetheless, the precious metal mineral exploration and mining is competitive. The Company competes with numerous other companies, including many large established mining companies having substantial capabilities and greater financial and technical resources than Lundin Gold. See “Risk Factors”.

• **Components**

Lundin Gold sources machinery, parts, reagents and services from large national and multinational suppliers to the mining industry who are outside of Ecuador and services and supplies from local businesses wherever possible according to its local procurement program.

The Company’s purchasing strategy for mine inventory items, mill components, consumables, and other items that are necessary for continued operation is to hold inventory quantities on hand to minimize the risk of shortages of materials and supplies when needed to avoid production delays. FDN is accessible by road from the Ports of Guayaquil and Bolivar. See “Risk Factors”.

• **Environmental Protection and Permitting**

Lundin Gold is committed to responsible mining, which includes environmental stewardship. The Company’s mining, exploration and development activities are subject to various laws and regulations relating to the protection of the environment in Ecuador, all of which is detailed in the Technical Report. See “The FDN Technical Report Summary”.

After completing a comprehensive EIA for the Project, the Company received its Environmental License in the fourth quarter of 2016, which was a condition to commencing development of the Project. The Environmental Licence covers the planned activities for the construction and operations phases of the Fruta del Norte Project and includes conceptual closure plans. The closure plan will be updated and approved two years prior to the commencement of mine closure. The Environmental Licence is not subject to renewal; its term runs until the end of FDN’s life of mine.

In the course of developing FDN, the Company also completed comprehensive environmental impact assessments for its power line to the Project and its quarry. In this regard, the Company was issued an environmental license for its power transmission line to FDN and entered into the Quarry Exploitation Agreement providing the Company with the right to exploit construction materials from the quarry.
To meet the requirements of its project financing, Lundin Gold also prepared an Environmental and Social Impact Assessment (the ESIA) compliant with the International Finance Corporation (IFC) Performance Standards for FDN. The ESIA outlines the potential environmental and social risks and impacts of the Project and related mitigations and offsets. The purpose of the ESIA is to provide a comprehensive summary of the processes and systems developed by Lundin Gold to minimize project risks and ensure that environmental and social impacts are foreseen and addressed at an early stage to prevent negative environmental and social consequences from construction to end of mine life. A summary of the Company’s ESIA is available at [www.lundingold.com](http://www.lundingold.com).

More information regarding Lundin Gold’s commitment to protecting the environment from the impact of its activities is available in the Company’s most recent Sustainability Report available at [www.lundingold.com](http://www.lundingold.com).

- **Social and Environmental Policies**

  Lundin Gold is committed to carrying out its business according to three fundamental principles: working safely, environmental stewardship and respect in all its activities. Lundin Gold believes that transparent and sustainable practices and being a good corporate citizen are central to the long-term success of its business. The Company seeks to create enduring relationships with local communities and stakeholders and to address social challenges that are priorities both for communities and for the business through partnerships. This commitment is expressed in the Company’s Responsible Mining Policy, which is available on the Company’s website at [www.lundingold.com](http://www.lundingold.com).

  This past year, the Company’s commitment to its fundamental principles was evident in a variety of ways:

  **Safety**

  Lundin Gold continued to build on safety initiatives on the Project, such as its visible leadership program and the risk assessment and mitigation program (Go-No-Go Program), to ensure a safe environment for all employees, contractors and visitors. The Company remains on track with its total recordable incident rate target of 0.70, achieving a rate of 0.69 at the Project for the year.

  **Environment**

  Lundin Gold follows leading environmental practices as defined by the National standards and IFC Performance Standards. Lundin Gold continues to implement initiatives to further its commitment to environment protection. One example is the Company’s plan for a water monitoring program which will involve the participation of local community members in monitoring the Company’s water management. The Company has also partnered with Conservation International Ecuador to implement a jointly developed biodiversity strategy. The objective of this program is to address net biodiversity loss due to the development and operation of FDN.

  **Respect**

  Lundin Gold has prioritized engagement with local and national stakeholders. Through a structured roundtable dialogue process, the Company has jointly identified local development priorities and has sought new partnerships to achieve these shared objectives. Lundin Gold is a member of the UN Global Compact and supports the UN Sustainable Development Goals.

  More information regarding Lundin Gold’s commitment to responsible mining is available in the Company’s most recent Sustainability Report available at [www.lundingold.com](http://www.lundingold.com).

- **Employees**

  The table below sets out the number of employees of the Company by location at the end of each of the last two financial years, including temporary positions where indicated.
<table>
<thead>
<tr>
<th>Financial Year</th>
<th>Ecuador Permanent Positions</th>
<th>Ecuador Temporary Positions</th>

<td>2019</td>
<td>310</td>
<td>1,497</td>
<td>5</td>
<td>0</td>
<td>1,812</td>
</tr>
</tbody>
</table>

As of the date of this AIF, none of the Company’s employees are unionized.

- **Foreign Operations**

Lundin Gold’s only assets are in Ecuador. Any changes in regulations (or the application of regulations) or shifts in political attitudes in Ecuador are beyond the control of the Company and may adversely affect its business. Future development and operations may be affected in varying degrees by factors such as government regulations (or changes to such regulations or the application of regulations) with respect to the restrictions on production, export controls, income taxes, expropriation of property, restrictions on repatriation of profits, environmental legislation, land use, water use, operating activities, land claims of local people and mine safety. The impact of these factors cannot be accurately predicted. See “Risk Factors”.

Last October, the country experienced large-scale protests, in particular by the country’s organized indigenous groups, against the austerity measures introduced by the GOE. The GOE had proposed the removal of historic subsidies on fuel to help meet the conditions of its extended funding facility with the International Monetary Fund (IMF). The removal of the fuel subsidies was suspended in order to end the widespread civil unrest; the GOE, however, remains committed to economic reform and continues to work towards a proposal that will meet the IMF’s requirements. The political landscape is expected to remain uncertain, as the country heads into general elections in February 2021.

**FRUTA DEL NORTE UPDATE**

Over the course of the Project, the Company has optimized its mine plan and updated certain estimates, projections and schedules since the Technical Report including: the PPR in 2017, the UPE in 2018 and most recently the 2020 LOMP (collectively, Updated Project Information).

The information below is a consolidation of the Updated Project Information and represents management’s current estimates, projections and schedules for FDN. The information must be read in conjunction with the Technical Report. None of these updates has resulted in material changes to estimates for the Project, including the mineral reserve or mineral resource estimates contained in the Technical Report.

**Overview of Changes to the Mine Plan**

Fruta del Norte’s mine plan has been optimized since the Technical Report. The plan is now designed based on primary-secondary stope sequencing versus end-slicing. Implementing this methodology provides greater operational flexibility with access to more areas of the ore body simultaneously and reduced backfill costs due to longer cure times and less binder requirements. The anticipated LOM is now 14 years.

Other changes to the mine plan included:

- Lower cut-off grade from 4.1 gram per tonne gold ("g/t gold") to 3.8 g/t gold for transverse stoping and from 5.1 g/t gold to 5.0 g/t gold for the drift and fill stopes.
• Better balancing of mining methods with a slight increase in transverse stoping from 72% to 75% of ore removed. The remainder will be mined using drift and fill techniques.

Reconciliation of Estimates of Probable Mineral Reserves

The following tables show the Company’s estimate of Probable Mineral Reserves at the Fruta del Norte Project as of December 31, 2019 as adjusted by the UPE and 2019 production.

For information with respect to the key assumptions, parameters and risks associated with the results of the Technical Report for the Project, the mineral resource and mineral reserve estimates included therein and other technical information, please refer to the Technical Report filed on SEDAR.

<table>

</tr>
</tbody>
</table>

(5) Gold cut-off grades for the different mining methods are listed in the table below:

<table>
<thead>
<tr>
<th>Gold Cut-off Grade</th>
<th>UPE</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transverse Stope</td>
<td>3.8</td>
<td>g/t</td>
</tr>
<tr>
<td>Overhand D&amp;F</td>
<td>5.0</td>
<td>g/t</td>
</tr>
<tr>
<td>Underhand D&amp;F</td>
<td>5.0</td>
<td>g/t</td>
</tr>
</tbody>
</table>

(6) The average silver metallurgical recovery is 81.6%. The silver price assumption was $20/oz. Silver was not considered in the calculation of the cut-off grade.
(7) Tonnages are rounded to the nearest 1,000 t, gold grades are rounded to two decimal places, and silver grades are rounded to one decimal place. Tonnage and grade measurements are in metric units; contained gold and silver are reported as thousands of troy ounces.
(8) Rounding as required by reporting guidelines may result in summation differences.
(9) Corresponds to mill feed.
Ron F. Hochstein, P. Eng., Lundin Gold’s President and Chief Executive Officer and Director, who is a "Qualified Person" within the meaning of this term in NI 43-101, is responsible for the Company’s estimates of mineral reserves and mineral resources on the Company’s mineral properties and all disclosure of scientific and technical information concerning mineral reserves and mineral resources in this AIF.

Operating Cost Estimate

Based on the LOMP, the Company has estimated operating cash costs at $109.91 on a per dry tonne milled basis and $419.70 on a per ounce basis, as follows:

<table>
<thead>
<tr>
<th>Area</th>
<th>Cash Cost ($/t)</th>
<th>Cash Cost ($/oz Au payable)</th>
</tr>

</tr>
</tbody>
</table>
**Taxes and Other Payments**

Below is a summary of the payments and taxes applicable to production from Fruta del Norte under Ecuadorian law and legal and tax stability granted to the Company under the IPA.

<table>
<thead>
<tr>
<th>Applicable Payment or Tax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Income Tax</td>
<td>AESA is subject to 22% corporate income tax on its gross income less deductible costs, including operating expenses and certain investments and fiscal charges applicable to revenues and pre-tax profits (see below).</td>
</tr>
<tr>
<td>Profit Sharing Contributions</td>
<td>AESA must make a total profit-sharing payment equal to 15% of its pre-tax income, less deductible costs. Of this amount, 3% is distributed to AESA’s employees and 12% is paid to the GOE, to be used for social investment projects involving health, education and housing through local organizations in the area surrounding the Fruta del Norte Project. Profit sharing payments are a deductible expense for income tax purposes.</td>
</tr>
<tr>
<td>Value Added Tax</td>
<td>AESA must pay VAT on goods and services purchased within Ecuador or imported from abroad, subject to certain exclusions for items such as Ecuadorian payroll, fuel, power, food and medicines. The standard rate of VAT is 12%. VAT paid by the Company after January 1, 2018 is refundable as a credit against other taxes paid by the Company. VAT paid on acquisitions of goods and services that has not been offset as a tax credit or refunded will be credited against the Sovereign Adjustment.</td>
</tr>
<tr>
<td>Royalties</td>
<td>In addition to the royalties to third parties outlined in <em>The FDN Technical Report Summary</em> later in this AIF, AESA is subject to a 5% net smelter royalty to the GOE from production. In accordance with the EA, advance royalty payments totaling $65 million have been paid to the GOE as of the date of this AIF. The advance royalty payments are being deducted against royalties payable at a rate equal to the lesser of 50% of the actual future royalties payable in a six-month period or 10% of the total advance royalty payment. In addition, under the Quarry Exploitation Agreement, royalties are payable to the Yantzaza GAD at a rate of 10% calculated on production costs to operate the Mountain Pass Quarry. Production costs include all direct and indirect costs including depreciation and amortization.</td>
</tr>
<tr>
<td>Sovereign Adjustment</td>
<td>To the extent that the GOE’s cumulative benefit falls below 50%, AESA will be required to pay an annual sovereign adjustment. Each year, the benefits to AESA will be calculated as the net present value of the actual cumulative free cash flows of the Fruta del Norte Project from its inception. The GOE’s benefit will be calculated as the present value of the cumulative sum of taxes paid including corporate income taxes, royalties, labour profit sharing paid to the State, non-recoverable value-added tax, and any previous sovereign adjustment payments.</td>
</tr>
<tr>
<td>Other Taxes</td>
<td>AESA is also subject to other taxes common to businesses operating in Ecuador including customs duties, capital outflow tax, municipal fees and property tax.</td>
</tr>
</tbody>
</table>
RISK FACTORS

There are a number of factors that could negatively affect Lundin Gold’s business and the value of the Shares, including the factors listed below. The following information pertains to the outlook and conditions currently known to Lundin Gold that could have a material impact on the financial condition of the Company. Other factors may arise that are not currently foreseen by management of Lundin Gold that may present additional risks in the future. Current and prospective security holders of Lundin Gold should carefully consider these risk factors.

Pandemic Virus Outbreak

A pandemic virus outbreak, such as the novel coronavirus (COVID-19), could lead to disruptions in many aspects of the Company’s business operations for a variety of reasons, including local government restrictions on transportation and the mobility of personnel, the mandated or voluntary closure of business operations, illness among the Company’s workforce, interruptions in the Company’s logistics and supply chain, delay at or closure of the Company’s refining and smelting service providers and global travel restrictions. Due to the current COVID-19 pandemic, Lundin Gold has implemented a temporary suspension of operations at Fruta del Norte. The Company cannot currently indicate the duration of the temporary suspension on the Company’s operations or its full impact. Furthermore, the COVID-19 pandemic has negatively impacted global financial markets and may continue to do so. As discussed in this AIF, the ultimate economic viability of the Company’s business is impacted by its ability to operate Fruta del Norte and/or to maintain adequate liquidity through potential sources of financing.

Community Relations

The Company’s relationships with communities near where it operates and other stakeholders are critical to ensure the future success of Fruta del Norte and the exploration and development of the Company’s other concessions. The Company’s mineral concessions, including Fruta del Norte, are located near rural communities, some of which contain groups that have been opposed to mining activities from time to time in the past, which may affect the operations at Fruta del Norte and its exploration and development activities on its other concessions in the short and long term. Furthermore, local communities may be influenced by external entities, groups or organizations opposed to mining activities. In recent years, anti-mining nongovernmental organization (NGO) and indigenous group activities in Ecuador have increased. These communities, NGOs and indigenous groups have taken such actions as civil unrest, road closures and work stoppages. Such actions may have a material adverse effect on Lundin Gold’s operations at Fruta del Norte and on its exploration activities and on its financial position, cash flow and results of operations. While the Company is committed to operating in a socially responsible manner, there can be no assurance that the Company’s efforts in this respect will mitigate against this potential risk.

Financing Requirements

A substantial portion of Lundin Gold’s revenues and cash flows are committed to satisfying its obligations under the Prepay and Stream Loans and the Senior Facility. To the extent that Lundin Gold does not generate (i) sufficient revenues and cash flow to satisfy its debt obligations or (ii) surplus revenues and cash flow from the Project, it will require additional capital to fund its debt obligations and costs and activities not related to the Project, respectively. If Lundin Gold raises additional capital by issuing equity, such financing may dilute the interests of shareholders and reduce the value of their investment. Moreover, Lundin Gold may not be successful in locating suitable additional or alternate financing when required or at all or, if available, Lundin Gold may incur substantial fees and costs and the terms of such financing might not be favourable to Lundin Gold. A failure to raise capital when needed could have a material adverse effect on Lundin Gold’s business, financial condition and results of operations.
Ability to Maintain Obligations or Comply with Debt

Lundin Gold is subject to restrictive covenants under the Prepay and Stream Loans, the Senior Facility and the COF. The Company’s project financing is secured by a first ranking charge over the assets of the Project Subsidiaries, by a pledge of the shares of the Project Subsidiaries and by guarantees of Lundin Gold and the Project Subsidiaries. In addition, Lundin Gold may from time to time enter into other arrangements to borrow money to fund its operations at Fruta del Norte or the exploration and development activities on its other concessions, and such arrangements may include covenants that have similar obligations or that restrict its business in some way.

Events may occur in the future, including events out of Lundin Gold’s control, that could cause Lundin Gold to fail to satisfy its obligations under the Prepay and Stream Loans, the Senior Facility or other debt instruments that may arise. In such circumstances, amounts drawn under Lundin Gold’s debt agreements may become due and payable before the agreed maturity date, and Lundin Gold may not have the financial resources to repay such amounts when due. If Lundin Gold were to default on its obligations under either the Prepay and Stream Loans, the Senior Facility, the COF or other secured debt instruments in the future, the lender(s) under such debt instruments could enforce their security and seize Lundin Gold’s assets.

Operating Risks

The Company’s operations are subject to risks and hazards inherent in the mining industry, including, but not limited to, unanticipated variations in grade and other geological problems, surface and ground water conditions, water balance and water chemistry, backfill quality or availability, underground conditions, metallurgy, ore hardness and other processing issues, critical equipment or process failure, the lack of availability of input materials and equipment, disruption to power supply, geotechnical incidents such as ground subsidence or landslides, accidents, labour force disruptions, supply chain/logistics disruptions, force majeure events, unanticipated transportation costs, consumable prices or availability and weather conditions, any of which can materially and adversely affect, among other things, the safety of personnel, the exploration and development of concessions, production quantities and rates, costs and expenditures, contractual obligations and financial covenants.

Ramp up of Mining Operations

The first few years of production from Fruta del Norte are subject to a number of inherent risks. It is not unusual in the mining industry for new mining operations to experience unexpected problems during the early stages of the production phase, including failure of equipment, machinery, the processing circuit or other processes to perform as designed or intended, inadequate water, insufficient ore stockpile or grade, and failure to deliver adequate tonnes of ore to the mill, any of which could result in delays, slowdowns or suspensions and require more capital than anticipated. In addition, estimated mineral reserves and mineral resources and anticipated costs, including, without limitation, operating expenses, cash costs and all-in sustaining costs, anticipated mine life, projected production, anticipated production rates and other projected economic and operating parameters may not be realized, and the level of future metal prices needed to ensure commercial viability may deteriorate. Consequently, there is a risk that Fruta del Norte may encounter problems or be subject to delays or suspensions during the early stages of the production phase, which may or have other material adverse consequences for Lundin Gold, including its operating results, cash flow and financial condition.

Instability in Ecuador

The Company is subject to certain risks and possible political and economic instability specific to Ecuador, arising from political unrest, labour disputes, invalidation of government orders, permits or property rights, local legal proceedings and referendums seeking to suspend mining activities, unsupportive local and regional governments, risk of corruption, military repression, war, civil disturbances, criminal and terrorist acts, hostage taking, changes in laws, expropriation, nationalization, renegotiation or nullification of existing concessions, agreements, licenses or permits and changes to monetary or taxation policies. The occurrence of any of these risks may adversely affect the
mining industry, mineral exploration and mining activities generally or the Company and, among impacts, could result in the impairment or loss of mineral concessions or other mineral rights.

Exploration, development or production may also be affected to varying degrees by government regulations with respect to, but not limited to, restrictions on future exploitation and production, price controls, export controls, income taxes, labour and immigration, and by delays in obtaining or the inability to obtain necessary permits, opposition to mining from environmental and other non-governmental organizations, limitations on foreign ownership, expropriation of property, ownership of assets, environmental legislation, labour relations, limitations on repatriation of income and return of capital, high rates of inflation, increased financing costs and site safety. These factors may affect both Lundin Gold’s ability to undertake exploration and development activities in respect of future properties in the manner contemplated, as well as its ability to continue to explore, develop and operate those properties in which it has an interest or in respect of which it has obtained exploration and development rights to date.

Any shifts in political attitudes or changes in laws that may result in, among other things, significant changes to mining laws or any laws, regulations or policies are beyond the control of Lundin Gold and may adversely affect its business. The Company faces the risk that governments may adopt substantially different policies, which might extend to the expropriation of assets or increased government participation in the mining sector. In addition, changes in resource development or investment policies, increases in taxation rates, higher mining fees and royalty payments, revocation or cancellation of mining concession rights or shifts in political attitudes in Ecuador may adversely affect Lundin Gold’s business.

Production Estimates

Forecasts of future production are estimates based on interpretation and assumptions, and actual production may be less than estimated. Unless otherwise noted, the Company’s production forecasts are based on full production being achieved from Fruta del Norte. Lundin Gold’s ability to achieve and maintain full production rates at Fruta del Norte is subject to a number of risks and uncertainties. The Company’s production estimates are dependent on, among other things, the accuracy of Mineral Reserve and Mineral Resource estimates, the accuracy of assumptions regarding ore grades and recovery rates, ground conditions, physical characteristics of ores, such as hardness and the presence or absence of particular metallurgical characteristics, the accuracy of estimated rates and costs of mining and processing and mill availability, and the receipt and maintenance of permits. The Company’s actual production may vary from its estimates for a variety of reasons, including those identified under the heading “Operating Risks”. The failure of the Company to achieve its production estimates could have a material adverse effect on the Company’s prospects, results of operations and financial condition.

Environmental Compliance

All of Lundin Gold’s exploration, development and production activities are subject to extensive environmental regulation. These regulations address, among other things, the emissions into the air, discharges into water, management of waste, management of tailings, management and shipment of hazardous substances, protection of natural resources, antiquities and endangered species and reclamation of lands disturbed by mining operations.

Some laws and regulations may impose penalties for environmental contamination, which could subject the Company to liability for the conduct of others or for its own actions that followed all applicable laws at the time such actions were taken. Environmental legislation is evolving in a manner that will result in stricter standards and enforcement, increased fines and penalties for non-compliance, potential to temporary shutdown of a portion or all of the operations at Fruta del Norte until non-compliance is corrected, more stringent environmental assessments of proposed projects and mine closure plans and a heightened degree of responsibility for companies and their
officers, directors and employees. Any future changes in environmental regulation could adversely affect the Company’s ability to conduct its operations.

The Company may need to address contamination at Fruta del Norte in the future, either for existing environmental conditions or for leaks or discharges that may arise from ongoing operations or other contingencies. Contamination from hazardous substances at Fruta del Norte may subject it to material liability for the investigation or remediation of contamination, as well as for claims seeking to recover for related property damage, personal injury or damage to natural resources.

Gold Price

The Company’s earnings, cash flow and financial condition are subject to risk due to fluctuations in the market price of gold. Gold prices have historically fluctuated widely. The price of gold is affected by numerous factors beyond Lundin Gold’s control, including levels of supply and demand, global or regional consumptive patterns, purchases or sales by government central banks, increased production due to new mine developments and improved mining and production methods, speculative activities related to the sale of metals, availability and costs of metal substitutes, international economic and political conditions, interest rates, currency values and inflation.

A significant decline in the gold price could cause Fruta del Norte operations to be uneconomic. Depending on the price of gold, the Company’s cash flow may be insufficient to meet its operating needs, debt obligations and capital expenditures, and as a result the Company could experience financial difficulties and may suspend some or all of mining activities or otherwise revise its mine plan and exploration and development plans. In addition, (i) there is a time lag between the shipment of gold and final pricing, and changes in pricing can impact the Company’s revenue and working capital position, and (ii) cash costs and all-in sustaining costs of gold production are calculated net of silver by-product credits, and therefore may also be impacted by downward fluctuations in the price of silver. Any of these factors could result in a material adverse effect on the Company’s results of operations and financial condition.

The estimation of economically viable identified Mineral Reserves requires certain assumptions, including gold price. A revised estimate of identified Mineral Reserves due to a substantial decline in the gold price could result in the decrease in the estimates of the Company’s Mineral Reserves, subsequent write downs and negative impact on mine life.

Shortages of Critical Resources

Disruptions in the supply of products or services required for the Company’s activities could adversely affect the Company’s operations, financial condition and results of operations. This may be the result of industry-wide shortages of certain goods or services, interruption in supplier operations or in transportation methods of certain goods, the risk of failure of certain long-lead items or the failure to obtain necessary permits for the supply of regulated goods. The Company’s costs may also be affected by the prices of commodities and other inputs it consumes or uses in its operations. The prices and availability of such commodities and inputs are influenced by supply and demand trends affecting the mining industry in general and other factors outside the Company’s control. Increases in the price for materials consumed in the Company’s mining and production activities could materially adversely affect the Company’s results of operations and financial condition.

Infrastructure

Mining, processing, development and exploration activities depend, to one degree or another, on adequate infrastructure. Reliable roads, bridges, and power sources are important elements of infrastructure, which affect capital and operating costs. The lack of availability on acceptable terms or the delay in the availability of any one or more of these items could prevent or delay the Company’s exploration, development or operating activities. If adequate infrastructure is not available in a timely manner, there is a risk that (i) the operations at Fruta del Norte...
will not achieve anticipated production, (ii) the operating costs associated with Fruta del Norte will be higher than anticipated, or (iii) the Company’s exploration and development activities will be not carried out as anticipated, or at all. Furthermore, unusual or infrequent weather phenomena, sabotage, community uprisings, government or other interference in the maintenance or provision of necessary infrastructure could adversely affect the operations at Fruta del Norte, cash flow and Lundin Gold’s financial position.

Title Matters and Surface Rights and Access

There is a risk that title to the mining concessions, the surface rights and access rights comprising Fruta del Norte and its related infrastructure may be deficient or subject to dispute. The procurement or enforcement of such rights can be costly and time consuming. In areas where there are local populations or landowners, it may be necessary, as a practical matter, to negotiate or enforce surface access. Despite having the legal right to access the surface and carry on mining activities, Lundin Gold may not be able to negotiate satisfactory agreements with existing landowners/occupiers for such access, and therefore it may be unable to carry out activities as planned. In addition, in circumstances where such access is denied, or no agreement can be reached, Lundin Gold may need to rely on the assistance of local officials or the courts in such jurisdictions, which may delay or impact exploration or mining activities as planned.

There is also a risk that the Company’s exploration, development and mining authorizations and surface rights may be challenged or impugned by third parties. Finally, there is a risk that developing laws and movements respecting the acquisition of lands and other rights of indigenous communities may alter the arrangements made by prior owners of the lands where Fruta del Norte is located. Future laws and actions could have a material adverse effect on Lundin Gold’s operations at Fruta del Norte or on its financial position, cash flow and results of operations.

Availability of Workforce and Labour Relations

The Company’s gold production and its exploration and development activities depend upon the efforts of Lundin Gold’s employees and contractors. The Company competes with mining and other companies on a global basis to attract and retain employees at all levels with appropriate technical skills and operating experience necessary to operate its mines. The conduct of the Company’s operations is dependent on access to skilled labour. Access to skilled labour may prove particularly challenging for Lundin Gold given the remote location of Fruta del Norte and local laws which impose thresholds for the representation of certain groups people on Lundin Gold’s workforce in Ecuador and the ability of foreign skilled labour to obtain visas to work in Ecuador. Shortages of suitably qualified personnel could have a material adverse effect on the Company’s business and results of operations.

The Company’s operations personnel are working, stationed and travel to and from Fruta del Norte, which is located in a remote region of Ecuador. While at site, these personnel are exposed to concentrated groups of people for lengthy periods of time. Any personnel or visitor becoming infected with a serious illness that has the potential to spread rapidly could place other personnel and the Company’s operations at risk. The 2020 outbreak of the COVID-19 is one example of such an illness. Although the Company takes every precaution to strictly follow health regulations and guidelines, there can be no assurance that COVID-19 or other infectious illnesses will not negatively impact Lundin Gold’s personnel or its operations.

Lundin Gold’s operations at Fruta del Norte depend upon the efforts of its employees, and the Company’s operations would be adversely affected if it failed to maintain satisfactory labour relations. The Company’s labour force is not unionized, and the introduction of a labour union could result in a disruption to production and/or higher costs and reduced flexibility. In addition, relations between the Company and its employees may be affected by changes in labour and employment laws. Changes in such legislation or in the relationship between the Company and its employees may have a material adverse effect on the Company’s business, results of operations, financial condition or prospects.
Health and Safety

Exploration and mining development and operating activities represent inherent safety hazards and maintaining the health and safety of the Company’s employees and contractors is of paramount importance to the Company. Health and safety hazard assessments are carried out regularly throughout the lifecycle of the Company’s activities, and robust policies, procedures and controls are in place. Notwithstanding continued efforts to adhere to the Company’s “zero harm” policy, safety incidents may still occur. Significant potential risks include, but are not limited to, surface or underground fires, rock falls underground, blasting accidents, vehicle accidents and unsafe road conditions or events, fall from heights, contact with energized sources, and exposure to infectious or occupational disease. Employees involved in activities in remote areas may also be exposed to attacks by individuals or violent opposition by local communities that may place the employees at risk of harm. Any incident resulting in serious injury or death could result in litigation and/or regulatory action (including, but not limited to suspension of development activities and/or fines and penalties), or otherwise adversely affect the Company’s reputation and ability to meet its objectives.

Government or Regulatory Approvals

Lundin Gold’s exploration and development activities and its operations depend on its ability to obtain, maintain or renew various mineral rights, licenses, permits, authorizations and regulatory approvals (collectively, Rights and individually a Right) from various governmental and quasi-governmental authorities. Government work stoppages may also impact the Company’s ability to obtain, maintain or renew certain Rights. Lundin Gold’s ability to obtain, maintain or renew such Rights on acceptable terms and on a timely basis is subject to changes in regulations and policies and to the discretion of the applicable governmental and quasi-governmental bodies. Lundin Gold may not be able to obtain, maintain or renew its Rights or its Rights may not be obtainable on reasonable terms or on a timely basis. It is possible that previously issued Rights may become suspended or revoked for a variety of reasons, including through government or court action. A delay in obtaining any such Rights, the imposition of unfavourable terms or conditions on any Rights or the denial of any Right may have a material adverse effect on Lundin Gold’s business, financial condition, results of operations and prospects and, in particular, the development and operations of Fruta del Norte.

Mineral Reserve and Resource Estimates

Mineral Reserve and Mineral Resource figures are estimates, and there is a risk that any of the Mineral Resources and Mineral Reserves identified at Fruta del Norte to date will not be realized. Until a deposit is actually mined and processed, the quantity of Mineral Resources and Mineral Reserves and grades must be considered as estimates only. In addition, the quantity of Mineral Resources and Mineral Reserves may vary depending on, among other things, precious metal prices. Any material change in quantity of Mineral Resources, Mineral Reserves or percent extraction of those Mineral Reserves recoverable by underground mining techniques may affect the economic viability of any project undertaken by Lundin Gold. In addition, there is a risk that metal recoveries during production do not reach anticipated rates.

Mineral Resources that are not Mineral Reserves do not have demonstrated economic viability, and there is a risk that they will never be mined or processed profitably. Further, there is a risk that Inferred Mineral Resources will not be upgraded to proven and probable Mineral Reserves as a result of continued exploration.

Fluctuations in gold prices, results of drilling, metallurgical testing and preparation and the evaluation of studies, reports and plans subsequent to the date of any estimate may require revision of such estimate. Any material reductions in estimates of Mineral Reserves could have a material adverse effect on Lundin Gold’s results of operations and financial condition.
Key Talent Recruitment and Retention

Recruiting and retaining qualified personnel is critical to Lundin Gold’s success. Lundin Gold is dependent on the services of key executives, including its President and Chief Executive Officer, and other highly skilled and experienced executives and personnel focused on managing Lundin Gold’s interests. The number of persons skilled in the financing, development, operations and management of mining properties is limited and competition for such persons is intense. The inability of Lundin Gold to successfully attract and retain highly skilled and experienced executives and personnel could have a material adverse effect on Lundin Gold’s business, financial condition and results of operations. The Company does not maintain any key man insurance with respect to any of its officers or directors.

Market Price of the Company’s Shares

Securities of mineral companies have experienced substantial volatility in the past, often based on factors unrelated to the financial performance or prospects of the companies involved. These factors include macroeconomic conditions in North America and globally, and market perceptions of the attractiveness of particular industries or sectors. The price of the Company’s Shares is also likely to be significantly affected by short-term changes in gold price, currency exchange fluctuations, or its financial condition or results of operations and exploration activities on its projects. Other factors unrelated to the performance of the Company that may have an effect on the price of the Company’s Shares include: the extent of analyst coverage available to investors concerning the business of the Company may be limited if investment banks with research capabilities do not follow the Company; lessening in trading volume and general market interest in the Company’s Shares may affect an investor’s ability to trade significant numbers of Shares of the Company; the size of the Company’s public float and whether it is included in market indices may limit the ability of some institutions to invest in the Company’s Shares; and, a substantial decline in the price of the Shares of the Company that persists for a significant period of time could cause the Company’s Shares to be delisted from an exchange, further reducing market liquidity. If an active market for the Shares does not continue, the liquidity of an investor’s investment may be limited, and the price of the Company’s Shares may decline. If an active market does not exist, investors may lose their entire investment in the Company. As a result of any of these factors, the market price of the Company’s Shares at any given point in time may not accurately reflect the long-term value of the Company. Securities class-action litigation often has been brought against companies following periods of volatility in the market price of their securities. The Company may in the future be the target of similar litigation. Securities litigation could result in substantial costs and damages and divert management’s attention and resources.

Control of Lundin Gold

As at the date hereof, Newcrest and the Lundin Family Trust are control persons of Lundin Gold. As long as these shareholders maintain their significant positions in Lundin Gold, they will have the ability to exercise influence with respect to the affairs of Lundin Gold and significantly affect the outcome of matters upon which shareholders are entitled to vote.

As a result of the holdings in the Company of control persons, there is a risk that the Company’s securities are less liquid and trade at a relative discount compared to circumstances where these persons did not have the ability to influence or determine matters affecting Lundin Gold. Additionally, there is a risk that their significant interests in Lundin Gold discourages transactions involving a change of control of Lundin Gold, including transactions in which an investor, as a holder of the Company’s securities, would otherwise receive a premium for its Company’s securities over the then-current market price.

Tax Regime in Ecuador

Tax regimes in Ecuador may be subject to differing interpretations and are subject to change without notice. The Company’s interpretation of tax law as applied to its transactions and activities may not coincide with that of the tax
authorities. As a result, the taxation applicable to transactions and operations may be challenged or revised by the tax authorities, which could result in significant additional taxes, penalties and/or interest.

There is a risk that restrictions on the repatriation of earnings from Ecuador to foreign entities will be imposed in the future and Lundin Gold has no control over withholding tax rates. In addition, there is a risk that laws and regulations in Ecuador may result in a capital gains tax on profits derived from the sale of shares, ownership interests and other rights, such as exploration rights, of companies with permanent establishments in the country. The Company will not likely be able to comply with this law as currently drafted as it does not have access to the information requested by the law. It is unknown at this time what, if any, liability the Company or its subsidiaries may be subject to as a result of the application of this law. There is a risk that the Company’s access to financing may be limited as a result of the indirect taxation.

**Measures to Protect Endangered Species and Critical Habitats**

Ecuador is a country with a diverse and fragile ecosystem and the national government, regional governments, indigenous groups and NGOs are vigilant in their protection of endangered species and critical habitats. The existence or discovery of an endangered species or critical habitats at Fruta del Norte may have a number of adverse consequences to the Company’s plans and operations. For instance, the presence of an endangered species could require the Company to take additional measures to protect the species or to cease its activities at Fruta del Norte temporarily or permanently, which would impact production from Fruta del Norte and would have an adverse economic impact on the Company, which could be material. The existence or discovery of an endangered species or critical habitat at Fruta del Norte could also ignite NGO and local community opposition to Fruta del Norte, which could impact operations at Fruta del Norte and the Company’s financial condition and global reputation.

**Non-Compliance and Compliance Costs**

Lundin Gold, its subsidiaries, its business and its operations are subject to various laws and regulations. The costs associated with compliance with such laws and regulations may cause substantial delays and require significant cash and financial expenditure, which may have a material adverse effect on the Company or the operation of Fruta del Norte.

There is a risk that the Company may fail to comply with a legal or regulatory requirement, which may lead to the revocation of certain rights or to penalties or fees and in enforcement actions thereunder, including orders issued by regulatory or judicial authorities causing operations to cease or be curtailed and may include corrective measures requiring capital expenditures, installation of additional equipment, or remedial actions. In addition, the Company may be required to compensate those suffering loss or damage arising from its non-compliant activities and may have civil or criminal fines or penalties imposed for violations of applicable laws or regulations and, in particular, environmental laws. Failure to comply strictly with applicable laws, regulations and local practices relating to mineral rights could result in loss, reduction or expropriation of entitlements. Any of the foregoing may have a material adverse effect on the Company or the operation of Fruta del Norte.

**Exploration and Development Risks**

The Company has the rights to 26 metallic mineral concessions targeted for exploration outside of the Fruta del Norte Project. The exploration for, and development of, new mineral deposits involves significant risks which, even with a combination of careful evaluation, experience and knowledge, may not be eliminated. Few exploration properties are ultimately developed into producing mines. Whether a mineral deposit will be commercially viable depends on a number of factors, including but not limited to: the particular attributes of the deposit, such as quantity and quality of the minerals, metallurgy and proximity to infrastructure and labour; mineral prices, which are highly cyclical; and government regulations, including regulations relating to prices, taxes, royalties, land tenure, land use, importing and exporting of minerals, and environmental protection. There is a risk that the exploration...
and development efforts and expenditures made by Lundin Gold will not result in any new discoveries of other mineral occurrences or new estimates of Mineral Resources or Mineral Reserves.

**Dependence on Single Project**

The only material property interest of the Company is Fruta del Norte. Unless the Company acquires additional property interests or advances its other exploration properties, any adverse developments affecting Fruta del Norte could have a material adverse effect upon the Company and would materially and adversely affect the profitability, financial performance and results of operations of the Company. While the Company may seek to develop and acquire additional mineral properties that are consistent with its business objectives, there can be no assurance that Lundin Gold will be able to identify suitable additional mineral properties or, if it does identify suitable properties, that it will have sufficient financial resources to acquire such properties or that such properties will be available on terms acceptable to the Company or at all.

**Illegal Mining**

Mining by illegal miners occurs on and near some of Lundin Gold’s mineral concessions in Ecuador. While this activity is monitored by both the Company and the government, the operations of artisanal and illegal miners could interfere with Lundin Gold’s activities and could result in conflicts. These potential activities could cause damage to Fruta del Norte, including road blockages, pollution, environmental damage or personal injury or death, for which Lundin Gold could potentially be held responsible. The presence of illegal miners can lead to project delays and disputes regarding the development or operation of gold deposits. Illegal mining can also result in mine stoppages, environmental issues and could have a material adverse effect on Lundin Gold’s results of operations or financial condition.

**Information Systems and Cyber Security**

The Company’s operations depend on information technology (IT) systems. These IT systems could be subject to network disruptions caused by a variety of sources, including computer viruses, security breaches and cyber-attacks, as well as disruptions resulting from incidents such as cable cuts, damage to physical plants, natural disasters, terrorism, fire, power loss, vandalism and theft. The Company’s operations also depend on the timely maintenance, upgrade and replacement of networks, equipment, IT systems and software, as well as pre-emptive expenses to mitigate the risks of failures. Any of these and other events could result in IT system failures, delays and/or increase in capital expenses. The failure of IT systems or a component of information systems could, depending on the nature of any such failure, adversely impact the Company’s reputation and results of operations.

Although to date the Company has not experienced any material losses relating to cyber-attacks or other information security breaches, there can be no assurance that the Company will not incur such losses in the future. The Company’s risk and exposure to these matters cannot be fully mitigated because of, among other things, the evolving nature of these threats. As a result, cyber security and the continued development and enhancement of controls, processes and practices designed to protect systems, computers, software, data and networks from attack, damage or unauthorized access remain a priority. As cyber threats continue to evolve, the Company may be required to expend additional resources to continue to modify or enhance protective measures or to investigate and remediate any security vulnerabilities.

**Insurance and Uninsured Risks**

Exploration, development and production operations on mineral properties involve numerous risks including, but not limited to, unexpected or unusual geological operating conditions, rock bursts, cave-ins, fires, floods, landslides, earthquakes and other environmental occurrences, risks relating to the storage and shipment of precious metal concentrates or doré bars, and political and social instability. Such occurrences could result in damage to mineral properties, damage to underground development, damage to production or infrastructure facilities, personal injury
or death, environmental damage to Lundin Gold’s properties or the properties of others, delays in the ability to undertake exploration and development, monetary losses and possible legal liability. Should such liabilities arise, they could reduce or eliminate future profitability and result in increasing costs and a decline in the value of the Company’s Common Shares.

Although Lundin Gold maintains insurance to protect against certain risks in such amounts as it considers reasonable, its insurance policies do not cover all the potential risks associated with a mining company’s operations. The Company may also be unable to maintain insurance to cover these risks at economically feasible premiums. Insurance coverage may not continue to be available or may not be adequate to cover any resulting liability. Moreover, insurance against risks such as environmental pollution or other hazards as a result of exploration, development and production may not be available to the Company on acceptable terms. Lundin Gold might also become subject to liability for pollution or other hazards which it may not be insured against or which the Company may elect not to insure against because of premium costs or other reasons.

Insurance limits currently in place may not be sufficient to cover losses arising from insured events. Losses from any of the above events may cause the Company to incur significant costs that could have a material adverse effect upon its financial performance and results of operations.

**Reclamation Obligations**

Reclamation requirements are designed to minimize long-term effects of mining exploitation and exploration disturbance by requiring the operating company to control possible deleterious effluents and to re-establish to some degree pre-disturbance land forms and vegetation. Lundin Gold is subject to such requirements in connection with its activities at Fruta del Norte and may be liable for actions and activities and disturbances caused by artisanal and illegal miners on the Company’s property. Any significant environmental issues that may arise, however, could lead to increased reclamation expenditures and could have a material adverse impact on Lundin Gold’s financial resources. Furthermore, environmental hazards may exist on the properties in which Lundin Gold holds interests which are unknown to Lundin Gold at present and which have been caused by previous or existing owners or operators of the properties.

There can also be no assurance that closure estimates prove to be accurate. The amounts recorded for reclamation costs are estimates unique to a property based on estimates provided by independent consulting engineers and Lundin Gold’s assessment of the anticipated timing of future reclamation and remediation work required to comply with existing laws and regulations. Actual costs incurred in future periods could differ from amounts estimated. Additionally, future changes to environmental laws and regulations could affect the extent of reclamation and remediation work required to be performed by Lundin Gold. Any such changes in future costs could materially impact the amounts charged to operations for reclamation and remediation.

**Violation of Anti-Bribery and Corruption Laws**

The Company’s operations are governed by, and involve interactions with, many levels of government in numerous countries. The Company is required to comply with anti-corruption and anti-bribery laws, including the Criminal Code, the Canadian Corruption of Foreign Public Officials Act and the U.S. Foreign Corrupt Practices Act, as well as similar laws in the countries in which Lundin Gold conducts its business. In recent years, there has been a general increase in both the frequency of enforcement and the severity of penalties under such laws, resulting in greater scrutiny and punishment to companies convicted of violating anti-corruption and anti-bribery laws. Furthermore, a company may be found liable for violations not only by its employees, but also by its contractors and third-party agents. Although Lundin Gold has adopted steps to mitigate such risks, such measures may not always be effective in ensuring that the Company, its employees, contractors and third-party agents will comply strictly with such laws. If the Company finds itself subject to an enforcement action or is found to be in violation of such laws, this may result
in significant penalties, fines and/or sanctions imposed on the Company resulting in a material adverse effect on the
Company’s reputation and results of its operations.

Climate Change

Changes in climate conditions could adversely affect Lundin Gold’s business and operations through the impact of
(i) more extreme temperatures, precipitation levels and other weather events; (ii) changes to laws and regulations
related to climate change; and (iii) changes in the price or availability of goods and services required in its business.

Climate change may lead to more extreme in temperatures, precipitation levels and other weather events. Extreme
high or low temperatures could impact the operation of equipment and the safety of personnel at Fruta del Norte,
which could result in damage to equipment, injury to personnel and production disruptions. Increased in
precipitation levels or extreme weather events, such as severe storms or floods, which may be more probable and
more extreme due to climate change, may negatively impact operations, disrupt production, lead to water
management challenges or breach of containment facilities. Significant capital investment may be required to
address these occurrences and to adapt to changes in average operating conditions caused by these changes to the
climate.

Increased environmental regulation and/or the use of fiscal policy by regulators in response to concerns over climate
change and other environmental impacts, such as additional taxes levied on activities deemed harmful to the
environment, could have a material adverse effect on Lundin Gold’s financial condition or results of operations.

Climate change may lead to changes in the price and availability of goods and services required for Fruta del Norte’s
operations, which requires the regular supply of consumables such as diesel, electricity, sodium cyanide and other
supplies to operate efficiently. The Company’s operations also depend on service providers to transport these
consumables and other goods to Fruta del Norte and to transport doré and concentrate produced by the Company
to refiners and smelters, respectively. The effects of extreme weather described above and changes in legislation
and regulation on the Company’s suppliers and their industries may cause limited availability or higher price for
these goods and services, which could result in higher costs or production disruptions.

The Company can provide no assurance that efforts to mitigate the risks of climate changes will be effective and that
the physical risks of climate change will not have an adverse effect on the Company’s operations and profitability.

Claims and Legal Proceedings

Lundin Gold may be subject to claims or legal proceedings in multiple jurisdictions covering a wide range of matters
that arise in the ordinary course of its current business or the Company’s previous business activities which could
materially adversely impact Lundin Gold.

Internal Controls

Internal controls over financial reporting are procedures designed to provide reasonable assurance that transactions
are properly authorized, assets are safeguarded against unauthorized or improper use, and transactions are properly
recorded and reported. A control system, no matter how well designed and operated, can only provide reasonable,
not absolute, assurance with respect to the reliability of financial reporting and financial statement preparation.

Security

The Company is exposed to various levels of safety and security risks which could result in injury or death, theft or
damage to property, work stoppages, or blockades of its mining operations. Risks and uncertainties include, but are
not limited to, terrorism, hostage taking, local drug gang activities, military repression, labour unrest and war or civil
unrest. Opposition to mining could arise and such opposition may be violent. Resistance or unrest in Ecuador could have a material adverse effect on our operations and profitability.

Conflicts of Interest

Certain directors and officers of Lundin Gold are or may become associated with other mining and/or mineral exploration and development companies, which may give rise to conflicts of interest. Directors who have a material interest in any person who is a party to a material contract or a proposed material contract with the Company are required, subject to certain exceptions, to disclose that interest and generally abstain from voting on any resolution to approve such a contract. In addition, directors and officers are required to act honestly and in good faith with a view to the best interests of the Company. Some of the directors and officers of the Company have either other full-time employment or other business or time restrictions placed on them and, accordingly, the Company will not be the only business enterprise of these directors and officers. Further, any failure of the directors or officers of the Company to address these conflicts in an appropriate manner or to allocate opportunities that they become aware of to the Company could have a material adverse effect on the Company's business, financial condition, results of operations, cash flows or prospects.

Dividends

Any payments of dividends on the Common Shares will be dependent upon the financial requirements of the Company to finance future growth, the financial condition of the Company, restrictions under Prepay and Stream Loans and the Senior Facility, and other factors which the Board may consider appropriate in the circumstance. It is unlikely that the Company will pay dividends in the immediate or foreseeable future.

Social Media and Reputation

As a result of the increased usage and the speed and global reach of social media and other web-based tools used to generate, publish and discuss user-generated content and to connect with other users, companies today are at much greater risk of losing control over how they are perceived in the marketplace. Damage to reputation can be the result of the actual or perceived occurrence of any number of events, and could include any negative publicity (for example, with respect to handling of environmental matters or Lundin Gold’s dealings with community groups), whether true or not. The Company places a great emphasis on protecting its image and reputation but does not ultimately have direct control over how it is perceived by others. Reputation loss may lead to increased challenges in developing and maintaining community relations, maintaining a positive relationship with government authorities, decreased investor confidence and an impediment to the overall success of Fruta del Norte in Ecuador, thereby having a material adverse impact on financial performance, cash flows and growth prospects.
THE FDN TECHNICAL REPORT SUMMARY

On June 15, 2016, Lundin Gold released the results of a NI 43-101 Technical Report, prepared by Amec Foster Wheeler. The firms and consultants who are providing Qualified Persons (QPs) responsible for the content of the Technical Report, which is based on a feasibility study completed in 2016 (the 2016 FS) and supporting documents prepared for the 2016 FS, are, in alphabetical order, Amec Foster Wheeler and Amec Foster Wheeler E&C Services Inc., Klohn Crippen Berger Ltd. (KCB), MM Consultores, NCL, and Roscoe Postle Associates Inc. (RPA). The QPs responsible for the Technical Report are as follows: Mr. Ignacy (Tony) Lipiec, P.Eng., Director, Process Engineering, Amec Foster Wheeler; Ms. Juleen Brown, MAusIMM CP, Mining Sector Lead - Environment, Amec Foster Wheeler; Mr. Simon Allard, P.Eng., Principal Consultant and Study Manager, Amec Foster Wheeler; Mr. Charles Masala, P.Eng., Associate Water Resources Engineer, Amec Foster Wheeler; Ms. Stella Searston, RM SME, Principal Geologist, Amec Foster Wheeler; Mr. Bryan D. Watts, P.Eng., Chairman and Principal, KCB; Mr. Alejandro Sepúlveda, RM CMC, Principal and Project Director, NCL; Mr. Anthony (Tony) R. Maycock, P.Eng., MM Consultores; and Mr. David A. Ross, P.Geo., Director, Resource Estimation, Principal Geologist, RPA. The Technical Report has been filed with Canadian securities regulatory authorities on SEDAR.

As outlined earlier in this AIF, the Company has completed three updates to the original estimates in the 2016 FS: the PPR in 2017, the UPE in 2018 and LOMP in early 2020. None of these updates has resulted in material changes to estimates for the Project, including the mineral reserve or mineral resource estimates contained in the Technical Report.

Except as where stated otherwise, the information below is stated as of the Technical Report effective date. The information contained in this section has been derived from the Technical Report, is subject to certain assumptions, qualifications and procedures described in the Technical Report and is qualified in its entirety by the full text of the Technical Report. Reference should be made to the full text of the Technical Report.

PROJECT DESCRIPTION AND LOCATION

The Fruta del Norte Project deposit is located within a 150 km long copper–gold metallogenic sub-province located in the Cordillera del Cóndor region. The nearest city to the Fruta del Norte Project area is Loja, the fourth-largest city in Ecuador. The Fruta del Norte Project is situated about 139 km east–northeast of Loja. Vehicular access from Loja to the Fruta del Norte Project site is via a 150 km long paved highway to the town of Los Encuentros. A 40 km long public gravel road connects Los Encuentros to the Fruta del Norte Project site.
MINERAL TENURE

At the Technical Report effective date, Lundin Gold’s mineral tenure holdings comprised 31 mining concessions that cover an area of approximately 74,855 ha.

As of the date of this AIF, Lundin Gold’s properties in Ecuador consist of 30 metallic mining concessions and three construction material concessions, covering an area of approximately 64,786 hectares. These concessions are currently registered in the name of the Company’s subsidiaries, AESA, AMSA and Surnorte.

The location of the La Zarza concession, which hosts the FDN deposit, is illustrated below.
At the Technical Report effective date, all of Lundin Gold’s concessions in Ecuador were held in the name of AESA, an indirect, wholly-owned subsidiary of Lundin Gold. In 2017, concessions not related to the Project were transferred to one of Lundin Gold’s Non-Project Subsidiaries, AMSA. The concessions were originally issued under Ecuador’s old mining laws with a 30-year term. With the reformation of the country’s mining laws in 2009, Lundin Gold’s concessions were registered in the Mining Registry and now have different expiry dates, ranging from 21–23 years from the date of registration. The majority of the concessions form a large contiguous block that extends from the Nangaritza River eastward to the international border with Peru.

Under the current mining law, medium and large mining concession terms are divided into two stages: exploration and exploitation. The exploration stage is further subdivided into shorter phases based on the achievement of stipulated milestones. Obligations that must be met to retain the concessions include payment of annual conservation fees, completion of annual reports on exploration completed, and proposed investment plans. Any failure to achieve these milestones and successfully advance to the next stage by the deadline can result in a forfeiture of the concession. In the final stage of exploration, referred to as the economic evaluation stage, an
application for exploitation can be made to the GOE. If successful, a concessionaire can then enter into an exploitation agreement with the GOE, and the concession term is the one negotiated under the agreement.

At the Technical Report effective date, four of Lundin Gold’s metallic concessions, including Duque, Princesa, Emperador 1 and Emperadora, were required to advance to the economic evaluation stage or be surrendered by Lundin Gold. Subsequent to the date of the Technical Report, three of these (Princesa, Emperador 1, and Emperadora) were combined and renamed the Emperador Concession; this concession was then converted to a small mining concession, and therefore not subject to the requirement to advance to economic evaluation. Applications were made and, as of the date of this AIF, are still pending to formally return the Caballero, Caballero 1 and Rey concessions to the Ministry of Energy and Non-Renewable Natural Resources. The remaining 22 metallic concessions were converted to small-scale mining concessions in 2018.

Surface rights must be obtained to support mining project development either through the land acquisition or by an easement (agreed with the land titleholder or imposed by the Ministry of Mining). As of the Technical Report effective date, 61 public deeds for required surface rights had been signed, covering a collective area of approximately 4,145 ha. Since then one additional public deed has been signed.

At the Technical Report effective date, seven land easements were concluded; these cover areas including the access road and construction of surface infrastructure to support mining activities. The term granted is equivalent to the duration of the La Zarza concession term, or the term and extensions of the EA between AESA and the GOE. Since then and as of the date of this AIF, all of the land easements required for the Project site have been obtained, including the easement rights required for construction of a transmission line to provide power to FDN.

Lundin Gold concluded one concession easement agreement with Cóndor Gold S.A. (Cóndor Gold) in 2017, to support construction and operation of access roads. The easement agreement is valid for as long as the underlying mining concessions held by Cóndor Gold remain current. In addition, subsequent to the Technical Report effective date an easement agreement was concluded with the Ecuadorian military to support construction of the North Access Road.

At the Technical Report effective Date, Lundin Gold holds seven water rights under a number of water tenures that collectively allow for 97.25 L/s of extraction. Six rights were granted for exploration purposes, and one water right allows for human consumption. After the Technical Report effective date, in November 2019, the Company received two key water permits from SENAGUA, being the Industrial Water Permit and Administrative Act, allowing it to move Fruta del Norte into production.

Agreements and Encumbrances

A 1% net revenue royalty is payable in perpetuity on production from Lundin Gold’s current mining concessions, including the La Zarza concession, under a royalty agreement dated November 16, 2007 among Lundin Gold’s subsidiaries (Aurelian Resources Inc., Aurelian Resources Corporation Ltd., and AESA) and two individuals, being Keith M. Barron and Patrick F.N. Anderson (the B&A Royalty).

As of the date of this AIF, Mr. Barron’s portion of the royalty (0.9 of 1%) has been assigned to Sandstorm Gold Ltd. and Mr. Anderson’s portion of the royalty (0.1 of 1%) has been assigned to Osisko Gold Royalties Ltd. Subsequent to the Technical Report effective date, the royalties payable on production from Lundin Gold’s concessions not related to the Project and held by AMSA and Surnorte were assigned to AMSA and Surnorte, respectively.

Since the Technical Report effective date, the Company has executed two additional royalty agreements:

- A 2% net smelter royalty is payable for any metallic minerals mined from the Rio Zarza and Valle del Inca 1 concessions acquired from Cóndor Gold, pursuant to a net smelter royalty agreement dated August 4, 2017.
• Under the Quarry Exploitation Agreement, royalties are payable to the Yantzaza GAD at a rate of 10% calculated on production costs to operate the Mountain Pass Quarry. Production costs include all direct and indirect costs including depreciation and amortization.

There are no other third-party royalties, back-in rights, payments, or other encumbrances on Lundin Gold’s concessions in Ecuador.

**Significant Factors That May Affect Access, Title, or the Ability to Work**

During 2015, Lundin Gold, through AESA, and the GOE worked collaboratively to establish the fiscal terms and conditions for the development of the Fruta del Norte Project. At the start of 2016, Lundin Gold announced that it had completed negotiations with the GOE and had settled the EA terms for the Fruta del Norte Project.

Subsequent to the Technical Report effective date, the Company signed the EA with the GOE on December 14, 2016. The key terms of the EA have been summarized later in this AIF. Coincident with the signing of the EA, Lundin Gold entered into the IPA with the GOE, the objective of which is to provide legal and fiscal stability and protection to AESA for its investment in the Fruta del Norte Project.

**HISTORY**

The Cordillera del Cóndor was first explored by Spanish conquistadors in the 1500s. There is evidence that pre-Columbians mined both hard rock and alluvial gold in the area. Spanish mining activity ceased about 1620, following conflict with local Indian tribes that had been enslaved to work in the mines. Artisanal alluvial miners began to prospect the Cordillera del Cóndor as early as 1935, both in Peruvian and Ecuadorian territory.

Completed activities have included stream sediment, rock chip, grab, soil and trench sampling, reconnaissance exploration, geological and structural mapping, ground and airborne geophysical surveys, genesis and modelling studies, core drilling, metallurgical testwork, project design studies, and preliminary marketing assessments. Kinross completed a pre-feasibility study in 2009 (2009 Kinross PFS), and a feasibility study in 2011 (2011 Kinross FS). Lundin Gold undertook the 2016 FS in 2015–2016, the results of which are documented in the Technical Report.

As of the date of the Technical Report, no commercial production has occurred from the Fruta del Norte Project; however, there were periods of active artisanal mining within the Fruta del Norte Project boundaries.

**REGIONAL, LOCAL AND PROPERTY GEOLOGY**

The Fruta del Norte deposit is located in the Cordillera del Cóndor region. The deposit is hosted by andesites of the Misahualli Formation and feldspar porphyry intrusions. The Cordillera del Cóndor region consists of sub-Andean deformed and metamorphosed Palaeozoic and Mesozoic sedimentary and Mesozoic arc-related lithologies that formed between the eastern flank of the Cordillera Real, and west of the flat-lying strata of the Amazon basin. Intruding the sub-Andean rocks is a composite I-type batholith, the Zamora Batholith, which has an elongate north–northeast axis that parallels the Ecuadorian Andes for over 200 km, extending into northern Peru. The batholith is considered to be the plutonic expression of a Jurassic-aged, subduction-related, continental magmatic arc established on the western margin of the Amazon craton. In the area of the Fruta del Norte deposit, the batholith consists of phases of monzonite, diorite and granodiorites with local porphyritic and aplitic dikes and breccia zones.

The Fruta del Norte deposit is an intermediate sulphidation epithermal gold–silver deposit measuring approximately 1,670 m along strike, 700 m down dip and generally ranging between 150 m and 300 m wide. The top of the deposit
is located beneath approximately 200 m of post-mineralization cover rocks. The eastern and western limits of the deposit are defined by two faults that together form part of the Las Peñas fault system that is thought to control the gold–silver mineralization. The southern limit of the mineralization along the fault system has not been fully defined by exploration activities.

**MINERALIZATION**

Mineralization is characterized by intense, multi-phase quartz–sulphide ± carbonate stockwork veining and brecciation over broad widths, typically between 100–150 m wide in the coherent central and northern parts of the system where the gold and silver grades are highest. Mineralized shoots are typically present within dilatant zones developed along inflections of vein strike or dip where the geometry permits maximum opening at the time of mineralization.

The mineralogy of Fruta del Norte Project consists of chalcedonic to crystalline quartz, manganese-carbonates, calcite, adularia, barite, marcasite, and pyrite, as well as subordinate sphalerite, galena, and chalcopyrite, and traces of tetrahedrite and silver sulphosalts. The bulk of the gold is microscopic and associated with quartz, carbonates and sulphides. Much of the gold is free milling, but the mineralization is moderately refractory, with approximately 40% of the gold locked in sulphides. However, coarse visible gold is commonly observed. Individual gold grains range from discrete specks less than 0.1 mm in size to broccoli-like, arborescent crystals >10 mm across. Visible gold occurs in all mineralized zones, in quartz or carbonate, as well as within pyrite or silver sulphosalt clusters.

Exploration has delineated a number of additional epithermal-style targets and prospects.

In the opinion of the QPs, the knowledge of the deposit settings, lithologies, mineralization style and setting, ore controls, and structural and alteration controls on mineralization is sufficient to support Mineral Resource and Mineral Reserve estimation.

**DEPOSIT TYPES**

The setting, alteration mineralogy and mineralization characteristics of the Fruta del Norte Project deposit are consistent with an intermediate sulphidation epithermal system. Some deposits with mostly low-sulphidation characteristics with respect to their alteration mineral assemblages have sulphide ore mineral assemblages that represent a sulphidation state between that of high-sulphidation and low-sulphidation deposits. Such deposits tend to be more closely spatially associated with intrusions, it has been suggested that intermediate sulphidation may be used for these deposits.

Intermediate-style epithermal systems are typically hosted in arc-related andesitic and dacitic rocks. Mineralization is silver- and base metal-rich and associated with Mn-carbonates and barite. Sulphide assemblages in intermediate-style epithermal systems typically comprise tennantite, tetrahedrite, hematite–pyrite–magnetite, pyrite, chalcopyrite, and iron-poor sphalerite. Quartz can be massive or display comb textures. Sericite is common as an alteration mineral, but the adularia, more typical of low sulphidation systems, is rare to absent. Fluid inclusions range from 3–5% to 10–20% sodium chloride.

The Fruta del Norte Project deposit and many prospects that have been identified in close proximity to the deposit are classified as intermediate sulphidation-style epithermal systems on the basis of:

- The abundance of manganese-rich carbonate at Fruta del Norte Project and the elevated base metal content (typically as iron-poor sphalerite and subsidiary tetrahedrite and chalcopyrite) are consistent with an intermediate sulphidation state;
- The extensional tectonic setting of mineralizing fluid emplacement and the affiliation with intermediate magma types also complements the classification in terms of redox states;
• Multiphase quartz–sulphide ± carbonate stockwork veining and brecciation over broad widths. Veins typically exhibit classic space-filling epithermal textures including intricate crustiform–colloform banding, and cockade and bladed calcite textures;
• Mineralization comprises apparently free gold, refractory gold in sulphides, and is silver-rich;
• Alteration comprises silica–pyrite alteration that grades outward and downward to silica–illite–pyrite alteration, and then to a silica (quartz, chalcedony)–illite–pyrite (±marcasite), carbonate mineral assemblage; and
• Sulphide assemblages include hematite–pyrite–magnetite and pyrite. Arsenopyrite, chalcopyrite, sphalerite, and galena have been noted.

Exploration programs that have used epithermal-style deposits as the geological model target have shown success in the Fruta del Norte Project area, having discovered the Fruta del Norte Project deposit and a number of prospects.

EXPLORATION

Kinross Exploration Grid

The Kinross exploration grid consisted of a north–south cut baseline with 100 m spaced east–west cut lines. The grid is based on UTM coordinates. The datum used in the survey network was originally the PSAD56 (Provisional South American) system applied to Zone 17S. Most data have been subsequently projected to UTM Zone 17S WGS84 using the using the EGM96 geoid to reference elevation. As part of the 2009 Kinross PFS 159 of the then total of 165 drill hole collars were re-surveyed. In addition, Leiva Engineering of Quito (Leiva) duplicated the northings and eastings of 25 road monuments and some of the old drill hole collars that had been surveyed by Kinross. It was found that the Kinross surveys corrected to an ellipsoid surface as opposed to EGM96 mean sea level; this resulted in the Leiva surveys having a 20 m difference from those of Kinross. As the 2009 Kinross PFS modelling efforts had begun using the ellipsoidal-corrected elevations, new infill-hole Z-coordinates used a 20 m constant addition to stay consistent with the original database. All initial collar coordinates have been recalculated in the EGM96 system. Leiva also established additional regional geodetic points in the Colibrí and Emperador concessions.

Ground Control Points

A ground control point at Las Peñas camp was established, guaranteeing a fixed “zero point” designated as GCP-01 (Ground Control Point-01). An Instituto Geográfico Militar (IGM) tie-in was set up on IGM point Los Encuentros-1 located 17.59 km west–northwest of Las Peñas, established (by the IGM) at Escuela Gabriela Mistral, in the village of Los Encuentros, Zamora. The Los Encuentros-1 data were purchased from the IGM in Quito. A tie-in to the International GPS System was performed by the AUSPOS processing engine of the University of New South Wales, Australia.

LiDAR Surveys

In February 2008, AESA contracted Network Mapping UK to conduct a light detection and ranging (LiDAR)/orthophotographic survey of a priority area in the Fruta del Norte Project covering 402 km². An integral part of the LiDAR survey was the establishment of an independent survey network using long (>1 hour) static observation sessions using a dual frequency differential receiver.

A digital terrain model survey set was acquired from IGM in 2005 that covers an area of 79.8 km². LiDAR data were acquired in February 2008 from a helicopter-mounted scanner. In 2010, Kinross commissioned Walsh Consultants (Walsh) to reprocess the LiDAR data with the purpose of reconstituting contours with corrected elevations. The LiDAR topography, orthophotos, Kinross survey and Leiva surveys have good agreement in northings and eastings; however, Walsh used the ellipsoidal-corrected elevations as a base reference.
Database Re-projection

The 2010 exploration grid was based on UTM Zone 17S coordinates using the PSAD56 datum. All data has since been re-projected to UTM Zone 17S using the EGM96 geoid to reference elevation. In 2010, Kinross retained Tetra Tech Wardrop (Wardrop) to assess the impact of implementing a new datum on collar coordinates, and on the subsequent translation of the geological interpretation (wireframes) to the new datum. Wardrop’s assessment included various comparisons of re-surveyed holes and a visual verification of the corrected database with the LiDAR produced surface. No significant offsets were noted between the corrected data set and the LiDAR surface. Geological wireframe translation was based on the average offset from the drill hole coordinates.

Geological Mapping

Geological and structural mapping have been completed from regional (1:25,000 scale) to prospect scale (1:2,000). Mapping results were used to identify areas of quartz veining, silicification and sulphide outcrop that warranted additional work. Data from remote sensing, geophysics, geological mapping and drilling were integrated to prepare an interpretation of the regional fault configurations. Analysis of Radarsat data showed that major topographic lineaments and regional geological contacts commonly trend north to south and northeast to southwest. The gaps in Cretaceous cover depicted from Radarsat are interpreted to coincide with pre- and/or post-Cretaceous fault zones. Geophysical data also defined a north–south-oriented fabric in proximity to Fruta del Norte. A more complex picture of lineament configurations was revealed from high-resolution Ikonos images where drainage patterns, in particular, showed systematically corrugated traces that may reflect localized offsets of the regional fault/lineament fabric.

Geochemical Sampling

Approximately 27,489 surface samples had been taken over the entire project area to the end of April 2016. Surface sampling was used as a first-pass exploration tool to identify areas of geochemical anomalies; some of these anomalies remain to be followed up.

Soil (6,252 samples), stream sediment (3,266 samples) and channel, adit, panel, pit, grab and rock sampling (3,015 samples) were collected between 1997 and 2007 by AESA and its predecessor companies to evaluate mineralization potential and generate targets for core drilling.

The soil geochemical surveys are very effective in outlining new areas of interest, while rock samples (boulders and outcrop) help to evaluate the potential of these areas and define targets for future drilling.

Geophysics

Ground geophysical programs completed to date within the Fruta del Norte Project area include gradient array, pole–dipole array IP resistivity and chargeability surveys. These have been effective in identifying intrusive rocks, faults, basin fill materials, zones of silicification, and pyrite-rich zones at depth. These methods are particularly effective at the regional level to help define geological and structural context in areas of interest. Because of the thick tropical vegetation and the very limited outcrop exposure in the Fruta del Norte Project area, IP has been very useful in defining the local geological context in order to help to better understand target areas. In addition, IP surveys are mainly used to identify zones of resistivity, which can be related to hydrothermal alteration (silicification), and zones of chargeability, which can be related to the presence of sulphides. The airborne geophysical program completed to date has included high-sensitivity airborne aeromagnetic and radiometric surveys. Both magnetic and radiometric data are useful at the regional scale to identify areas of interest, major boundaries which can be related to faults, or define geological domains, and large scale targets. Zones of anomalously low magnetic signature can be associated with hydrothermal alteration when hydrothermal fluids destroy magnetic minerals in the rocks. Zones of anomalously high radiometric values (gamma-rays) may be related to potassic alteration (clays).
Pits and Trenches

Trenching was performed by Climax in 1996–1997 to evaluate areas of artisanal mine workings in the Castillo and Bonza–Las Peñas areas. These trenches were later re-opened by AESA. All trenches were geologically mapped and channel sampled.

PETROLOGY, MINERALOGY, AND RESEARCH STUDIES

Kinross and Aurelian Studies

Preliminary microprobe studies were completed to support gold fineness assessments. Mineralogical studies were commissioned during 2007 to verify minerals associated with veining, in particular to determine the presence of adularia. Samples of hydrothermal minerals (molybdenite, marcasite and adularia) and igneous units were selected and submitted to the Colorado State University for radiometric isotope dating by rhenium/osmium ratios and to the University of British Columbia for dating by argon-argon and uranium/lead methods (Ar40/Ar39, U/Pb). Extensive mineralogical and mineral deportment studies were also completed as part of the 2009 Kinross PFS and the 2011 Kinross FS.

SRK Alteration Study

SRK conducted an alteration study and associated modelling exercise during 2015 to:
- Characterize the extent of the degradation zones within the Suárez Formation conglomerate; postulate causes;
- Characterize zones of hydrothermal sericite and clay minerals within and surrounding the gold mineralization; extrapolate for exploration vectoring in other concession areas; and
- Quantify total clay contents within the gold mineralization using a suite of X-ray mineral liberation clay quantification analyses.

SRK conducted a degradation survey involving graphic logging of the Suárez Formation conglomerate intercepts and collection of associated infrared spectra. Data was collected at a spacing of one spectrum per box for the entire length of 83 historical drill holes. Graphic logging data were compiled into a digital database, and a comparison of current and historical core box photographs was completed in PowerPoint format for 58 of the 83 drill holes examined during the degradation survey.

An inspection of drill core indicates that degradation within the Suárez Formation conglomerate is inhomogeneous and does not involve significant volume increase through the production of swelling clays. Degradation is strongest in intervals that are observed or interpreted as containing disseminated pyrite. It is interpreted that the pyrite breakdown upon exposure to air or water leads to the generation of sulphuric acid, which promotes acid attack and further breakdown of pyrite and clay minerals.

The products of core degradation include the residual (i.e. pre-existing) clay minerals paragonite, illite, and minor smectite, and an enhanced concentration of fine-grained silica. The fine-grained silica is interpreted to be amorphous silica that becomes concentrated upon destruction of the smectite. Silicification in the lower parts of the Suárez conglomerate prevents degradation.

The speed of reactions that lead to degradation of the Suárez Formation conglomerate is uncertain. Systematic monitoring and collection of photographs and infrared spectra from the Suárez Formation conglomerate sections of 2015 MET1 holes is necessary in order to determine the speed of degradation.
Exploration Potential

Exploration along the Las Peñas fault zone remains the first priority in the region, since the discovery of the Fruta del Norte gold–silver deposit. Exploration in 2011 continued to focus on the Las Peñas fault zone, more specifically in the La Zarza, Princesa, Sachavaca and Colibri concessions where epithermal (and possibly mesothermal) systems were targeted.

Since acquiring AESA from Kinross in 2014 to the Technical Report effective date, Lundin Gold exploration work mainly focused on concessions outside of La Zarza and included prospecting, geological mapping, trenching, rock sampling and associated geochemistry, as well as a geophysical survey of key exploration targets. Among epithermal targets selected for further exploration within the La Zarza concession are the FDN SW, Alejandro and Fruta del Norte East targets, all of which have received some previous work.

Additionally, although historically not a principal commodity focus for AESA, stand-alone, porphyry-hosted deposits, both associated with and proximal to the Las Peñas fault zone, provided secondary tier objectives for future exploration programs. Porphyry-related targets include the Tranca-Loma, Sandia and Papaya targets.

Since the Technical Report effective date, expanded geochemical sampling, geological mapping and geophysical surveys continue to identify a number of anomalies, a portion of which have been drill tested. Exploration programs conducted are appropriate to the work phase conducted at the time. The methods used were adequate for the models used of epithermal- and porphyry-style deposits, and the results were instrumental in properly outlining the extent of the mineralization and defining the Fruta del Norte Project deposit and other prospects. There is considerable remaining exploration potential within the Fruta del Norte Project area.

DRILLING

At the Technical Report effective date, drilling completed within the Fruta del Norte Project area to 1 December 2015 totalled 479 core holes (171,831 m). Within these programs, the drill campaigns completed on the La Zarza concession between 1997 and 1 December 2015 consisted of 438 holes (162,200 m) completed at the Fruta del Norte Project deposit, on areas with potential to host infrastructure, and on a number of exploration prospects within the La Zarza concession. A total of 284 holes (126,708 m) were completed at the Fruta del Norte Project deposit. No drilling occurred on the Fruta del Norte Project between 1 December 2015 and 25 April 2016.

Drilling has been by core methods. Core sizes drilled include HQ (63.5 mm core diameter) and NQ-sized core (47.6 mm) for exploration purposes, and lesser diameter HQ3–NQ3 (for geotechnical purposes), NTW (56 mm) and BTW (42 mm) core sizes.

Following arrival at camp, the core was photographed, recovery was measured, and the core was geotechnically logged. Lithological logging followed with the geologist recording a detailed description of the lithology, texture, alteration, mineral assemblage and intensity and level of oxidation/weathering. A graphic log column with a sketch of the geology was also included.

Drill recoveries were acceptable. Lower recoveries during the 2015 drilling (with respect to previous programs) may in part be due to the number of the 2015 drill holes drilled to the west of the Fruta del Norte Project deposit, and others drilled outside the Fruta del Norte Project deposit to better define known fault zones where lower core recovery and drill hole problems could be expected.

During the 2005 to 2007 drill programs, professional Ecuadorian surveyors using a Total Station survey instrument located drill hole collars. During the same programs, the existing Climax drill collars were surveyed, where they could be located. Drill holes completed since 2009 were surveyed by AESA–Kinross or Lundin Gold personnel using Total Station survey instruments. As part of the quality assurance and quality control (QA/QC) process, at the end
of the Lundin Gold drill program the local engineering firm Leiva was contracted to survey the drill collars using differential double frequency GPS equipment.

Core holes from the Climax programs were surveyed by either acid tests or Tropari tests. The initial AESA–Kinross programs used a Sperry Sun or Tropari single shot survey instrument taking a measurement every 50 m, or a Flexit digital multi-shot survey instrument with a reading every 30 m down the drill hole. Later programs used Flexit and Reflex digital multi-shot survey instruments. For the 2015 Lundin Gold drilling program, a Reflex EZ-TRAC digital down hole survey instrument was used.

The deposit was systematically drilled out on 50 m to 100 m sections between lines 2500N and 3900N. The grade and mineralization intensity characteristics clearly delineated zones of high grade and high tonnage mineralization in the north versus more disperse, albeit locally high grade mineralization, in the south. Infill drilling on 50 m centres was focused over 300 m of strike between 3300N and 3600N. The drilling tactic typically involved fan drilling from the pad collar to facilitate between 50 m and 25 m infill drilling before stepping out across strike to define the up or down dip geometry. Even though the majority of AESA core holes were drilled with an easterly (approximately 090°) azimuth and the dominant dip of the mineralized system is west, no single method or percentage adequately describes the complex relationship between down hole (core) length and the true width of the intersected mineralized zones. Drill hole inclinations vary significantly (from -45° to -84°) and the mineralized zones have variable dips from moderate to steep westerly to steep easterly dips. Therefore, most drill holes intercept the mineralized zones at an angle, and the drill hole intercept widths reported for the Fruta del Norte Project are greater than true widths.

The density determination methodology consisted of the water-displacement method. Measurements were made from every hole at an interval rate of approximately 50 m in unmineralized rock and every 20 m in the mineralized system. Rock density is relatively constant within specific lithologies and shows only minimal variation between different lithological groups.

During the Climax drill program, core was sawn in half and sampled at 2 m intervals, regardless of geology. Each sample consisted of 2 m composites of half core, with the exception of the first and last intervals in each hole. AESA–Kinross and Lundin Gold core was sampled using the following criteria:

- Maximum sample length of 2 m in un-mineralized lithologies;
- Maximum sample length of 1 m in mineralized lithologies;
- Smaller samples may be selected around high-grade, visible gold-bearing veins; and
- Minimum sample length of 20 cm.

Drill core was split along the long axis using core saws. Areas of very soft rock were cut using a machete and sections of very broken core were sampled using spoons. The right hand side of the core was always sampled.

**SAMPLING, QUALITY CONTROL MEASURES AND DATA VERIFICATION PROCEDURES**

**Sample Preparation Methods and Quality Control Measures Employed Before Dispatch**

A number of independent laboratories were used during the core drilling exploration and delineation phases. Sample preparation facilities included ALS Quito, Inspectorate Quito, and SGS Santiago; analytical facilities included ALS Vancouver, ALS Lima, Inspectorate Lima, SGS Toronto, and SGS Antofagasta. Sample preparation included drying the sample, crushing to initially >70% passing 2 mm, and later changed to 90% passing, then pulverizing to better than 85% (90%) passing 75 µm in the initial programs, which changed to pulverizing to better than 90% passing 100 µm.

The quality control (QC) program implemented has varied considerably over time in terms of the frequency of insertion and the source of the certified reference materials (CRMs) or standard reference materials (SRMs). Programs typically included submission of blank samples, CRMs/SRMs, field and reject duplicates and pulp check...
assaying. Ongoing monitoring of the program was performed by the operators, with spurious results being investigated and changes implemented when required.

The quantity and quality of the lithological, geotechnical, collar and downhole survey data collected in the exploration and infill drill programs conducted by AESA–Kinross and Lundin Gold are sufficient to support Mineral Resource and Mineral Reserve estimation. Sample collection, sample preparation, analytical methods and sample security for all AESA–Kinross and Lundin Gold drill programs are in line with industry-standard methods for epithermal gold–silver deposits and can support Mineral Resource and Mineral Reserve estimates.

During the Lundin Gold programs, drill core was delivered to the camp where it was labelled, photographed, logged and sampled under the supervision of staff geologists.

After the geologist marked out the sample intervals, drill core was split. The following standard sampling procedures were employed:

- After cutting, half the core was placed in a new plastic sample bag and half was returned to the core box;
- Samples were clearly and securely bagged and tagged and QC samples inserted into the sequence; and
- Batches of core samples were bagged, tagged, and packed in plastic buckets for shipment.

Sample Shipment and Security

Once ready for shipment, a list of sample batches and included samples were sent via electronic mail to camp administration and logistics, to the sample preparation laboratory, and to camp security, before the sample batches left camp. The Las Peñas camp has 24-hour security, which includes monitoring of the core shed area. Drilling samples were then transported from camp overland by a transport company truck directly to Quito where the custody of the samples was transferred to laboratory personnel. During transport camp security maintained communication with the transport company driver in order to track the progress and safety of the transport truck.

No AESA, Kinross or Lundin Gold personnel conducted any sample preparation. Preparation and analysis of the Fruta del Norte Project samples were completed at independent laboratories.

Assaying and Analytical Procedures

Pulp reject samples were submitted to Inspectorate in Lima and SGS in Toronto from 2006 to 2008, and to Inspectorate in Lima during 2015. Check assays prior to 2015 were not supported through the inclusion of blank and CRM samples with sample submissions. As of 2015, CRM samples were included in the check assay sample batches.

The results of the secondary and tertiary laboratory testing were analyzed using basic statistics, scatter, quantile-quantile, and percent relative difference plots, separately for each primary laboratory, and considering the method type employed, for both gold and silver.

The results of the check assay review demonstrate overall good correlation of the ALS Vancouver laboratory with results from both Inspectorate Lima and SGS Toronto. A slight high bias is observed between the primary laboratory and SGS Toronto at grades above approximately 5 g/t Au and Inspectorate Lima above approximately 18 g/t Au. The Inspectorate Lima data set is less scattered than SGS Toronto.

The original ALS Lima gold results were compared with the results from the secondary and tertiary laboratories, considering the analytical method employed at the primary laboratory. The results indicate an improvement in correlation with the adoption of method code AU-AA24 (fire assay with atomic absorption spectroscopy finish) from method code ICP22 (fire assay with inductively-coupled plasma – atomic emission spectroscopy or “ICP-AES” finish) by ALS Lima; however, both methods compare well, particularly below 10 g/t Au. The slight positive bias observed in the ALS Vancouver laboratory remains present in the ALS Lima laboratory, where assays were finished using ICP-AES. Following the ALS Lima method code switch to AU-AA24, the bias is no longer present.
Comparative statistics of the silver assay results demonstrated mixed results, depending on the assay method employed. During 2006, a small number of pulp reject samples were submitted to Inspectorate Lima for four-acid digestion and to SGS Toronto using method code FA-ICP-OES, in addition to the standard method codes. The SGS Toronto FA-ICP-OES results are particularly poor; however, the laboratory utilizes a separate analytical technique that differs from the standard technique. Good correlation exists between ALS Vancouver with both Inspectorate Lima and SGS Toronto, although ALS Vancouver results assay slightly higher than Inspectorate Lima. This bias was reduced to a negligible amount following the 2007 switch to ALS Lima as the primary assaying facility.

**Quality Assurance and Quality Control**

The quantity and quality of the lithological, geotechnical, collar and downhole survey data collected in the exploration and infill drill programs conducted by AESA–Kinross and Lundin Gold are sufficient to support Mineral Resource and Mineral Reserve estimation. Sample collection, sample preparation, analytical methods and sample security for all AESA–Kinross and Lundin Gold drill programs are in line with industry-standard methods for epithermal gold–silver deposits and can support Mineral Resource and Mineral Reserve estimates. At the end of the 2009 and 2010 infill programs, AESA–Kinross site personnel compiled and checked all certificates against the database for all elements. The comparison showed no errors. Kinross also did a manual 5% check of the 2010 drill assay data on site in June 2010. No errors were identified.

RPA performed database audits in support of Mineral Resource estimates in 2009, 2014, 2015, and 2016, and in support of compilation of a technical report in 2014. Data verification activities included detailed reviews of the standard operating protocols, drill hole spacings, core diameters used, how the final collar coordinates were determined, down hole surveying procedures, drill core logging protocols, core recovery, collection of bulk density data, sample layout, sample preparation and sample security procedures, and QA/QC protocols. During site visits in 2009, 2014, and 2016, RPA reviewed drill core data from numerous drill holes and compared observations with assay results and descriptive log records made by AESA–Kinross geologists. In addition to reviewing core, RPA examined outcrops, drill rigs, sampling procedures and other general exploration protocols. RPA is of the opinion that database verification procedures for the Fruta del Norte Project comply with industry standards and are adequate for the purposes of Mineral Resource and Mineral Reserve estimation.

**MINERAL PROCESSING AND METALLURGICAL TESTING**

Metallurgical testwork commenced in 2006. Initial testwork and project design by AESA–Kinross focused on a pressure oxidation (POX) flowsheet. Prior to the 2015–2016 metallurgical programs, Kinross conducted a metallurgical program to assess the potential of a flowsheet to produce a saleable concentrate in conjunction with the production of doré from cyanidation of a gravity concentrate and flotation tailings. This work assessed the differences between a gravity, flotation, leach (GFL) versus a gravity, leach, flotation (GLF) flowsheet. The outcome of the testwork indicated that the GFL flowsheet was the preferred option due to improved metal recoveries and lower capital and operating costs. Amec Foster Wheeler reviewed the Kinross data and, due to the capital costs associated with a POX plant, concurred with the GFL flowsheet approach. As a result, much of the initial POX-related testwork is not relevant to the current design.

During the 2016 FS, the Early MET, Fruta del Norte MET1 (MET1) and Fruta del Norte MET4 (MET4) testwork programs were carried out under the supervision of Amec Foster Wheeler. Metallurgical testwork programs were completed at SGS Minerals S.A. in Santiago, Chile for Met 1 and at SGS Lakefield in Ontario, Canada, for Early MET and MET4 programs. The results of each testwork program were independently reported by each SGS laboratory. While the Early MET program provided early confirmation of the GFL flowsheet, the MET1 and MET4 programs provide the basis of the new FS design.

Physical characterization testwork was carried out on selected drill core intervals for both the MET1 and MET4 programs. The characterization work included semi-autogenous grind (SAG) comminution (SMC) testing and Bond
ball mill work indices. In total, 24 MET1 and 14 MET4 samples were submitted for SMC testing and representative samples of each MET1 composite were submitted for Bond ball mill work indices. Based on the individual SMC results, the orebody can be classified as moderately hard in comparison to the Julius Kruttschnitt Mineral Research Centre database. These results remain consistent with the previous testwork programs and historical data on the deposit.

Both MET1 (composite and variability) and MET4 samples were submitted to gravity concentration using laboratory scale Knelson concentrators. The Knelson concentrator feed size was approximately 150 µm for both MET1 and MET4 programs. The amount of gold that potentially can be recovered by gravity in this deposit is considered high, as supported by the global recovery results of the gravity testwork and automated scanning electron microscopy of the head feed. Of note is the additional recovery of silver, suggesting that a large proportion of free gold is in the form of electrum. Leaching characteristics of the gravity concentrates were also investigated. Gold extraction rates were found to be consistent with industry norms. MET1 and MET4 composite samples tested achieved between 94% and 98% leached gold recovery from the gravity concentrates produced.

A sulphide flotation test program was developed for the production of a gold- and silver-rich concentrate, knowing that flotation tailings would be subsequently cyanide leached. The objective of the flotation circuit was to recover fine free gold and gold associated sulphides to produce a saleable concentrate. During the MET1 program each variability sample was subjected to an open circuit flotation test to determine the optimal flotation conditions. Subsequently, the MET1 composite sample and MET4 sample were submitted to locked cycle test at the optimal conditions, using the same flowsheet. All samples tested reported only moderate gold recoveries. The overall flotation process requires lengthy residence time and relatively high reagent dosage as a result of the middlings gold being a combination of sulphide and quartz associations. Analysis of the flotation tailings indicates fine free gold, gold associated sulphide and gold associated quartz occlusions, which cannot be recovered by conventional sulphide flotation. Final concentrates showed reasonable gold and silver grades, with mid-level impurities. Overall, the concentrates produced are considered suitable for sale to a smelter for further processing.

Bottle roll leaching tests were performed on each variability and composite sample (including MET4). During the MET1 composite testing, kinetic studies were carried out using air and oxygen injection methods. In addition, a pre-oxidation stage was tested to determine the optimal leaching conditions. Kinetic testing of each composite showed negligible difference between using air, oxygen and pre-oxidation. Ultimate leach recoveries between 51.3% and 64.4% were obtained after 24 hours of leaching. The MET4 program leaching results confirmed the ultimate recoveries obtained in the MET1 program. Cyanide consumption during the leach tests was low due to the recovery of sulphides to the concentrate during the flotation stage.

Additional testwork in support of the plant and process design included cyanide detoxification testing, using the Inco SO2/air process, and settling testwork on detoxified MET1 tailings composite samples to determine the optimal flocculant dosage and corresponding settling rate.

The metallurgical testwork completed to-date is based on samples which adequately represent the variability of the proposed mine plan.

Gold recovery relationships were developed for the flotation circuit (grade/recovery curves) and for the total number of gold units reporting as doré (via gravity recovery and flotation tailings carbon-in-leach (CIL)). All recovery relationships are bounded by the condition of the Au–S ratio of the flotation feed ≤10 g/t Au:% S. The boundary was checked against the monthly reported grades and resulting Au–S ratios of the feasibility study mine plan. All monthly values reported in the mine plan were found to fit within this boundary.

As at the Technical Report effective date, recovery estimates are based on the MET program testwork results. The LOM plan (LOMP) average gold metallurgical recovery is set at 91.7%. Actual gold recoveries are expected to range between 91.4–92.1%
The two products of the plant, gold concentrate and doré, are considered saleable without major penalties. The levels of arsenic lead and mercury in the flotation concentrate are expected to be able to be maintained at acceptable levels.

MINERAL RESOURCE ESTIMATES

Quantity and Quality of Minerals in Resource Estimate

A total of 246 drill holes support the estimate. There was no drilling on the Fruta del Norte Project in the years 2013 to 2014 inclusive. Assay results from the 2015 drilling were not available at the time of the resource estimate update. Therefore, the most recent drill holes used to estimate Mineral Resources were drilled in 2012, and the effective date of the current Mineral Resource model is December 1, 2015.

Forty-nine holes totalling 12,529 m were drilled in 2015 for various purposes including geotechnical, metallurgical, and structural geology. Assay data for these holes were not available at the time of resource grade interpolation and therefore were not included in the estimates. Subsequent to the completed estimate, RPA has tested these new data against the block model and has confirmed that these holes have no significant effect on the Mineral Resource estimate results.

Mineral Resources are summarized in Table 1 and have been classified using the 2014 Canadian Institute of Mining and Metallurgy Definition Standards for Mineral Resources and Mineral Reserves (the 2014 CIM Definition Standards).

Mineral Resources are reported inclusive of Mineral Reserves at a block cut-off grade of 3.5 g/t Au, assuming underground mining methods. Silver was not included in the cut-off grade calculation due to its relatively low grade and small contribution to the value of the mineralization.

Mineral Resources that are not Mineral Reserves do not have demonstrated economic viability.

Notes:
(1) The QP for the estimate is Mr. David Ross, P.Geo., an employee of RPA. The estimate has an effective date of 31 December 2015.
(2) Mineral Resources are reported inclusive of Mineral Reserves; Mineral Resources that are not Mineral Reserves do not have demonstrated economic viability.
(3) Mineral Resources are reported at a cut-off grade of 3.5 g/t Au; which was calculated using a long-term gold price of $1,500/oz.
(4) Mineral Resources are constrained within underground mineable shapes that assume a minimum thickness of 2 m; metallurgical recovery of 94%; total operating costs of $145/t milled (mining cost of $60/t milled; process costs of $35/t milled; G&A costs of $15/t milled; surface infrastructure costs of $28/t milled; concentrate transport and treatment costs of $7/t milled); royalties of $71/oz and selling costs of $65/oz.
(5) Numbers may not sum due to rounding.
Key Assumptions, Parameters and Methods Used to Estimate

Factors which may affect the Mineral Resource estimates include: metal price and exchange rate assumptions, changes to the assumptions used to generate the cut-off grade value, changes in local interpretations of mineralization geometry and continuity of mineralization zones, density and domain assignments, changes to design parameter assumptions that pertain to stope designs, changes to geotechnical, mining and metallurgical recovery assumptions, assumptions as to the continued ability to access the site, retain mineral and surface rights titles, obtain environmental and other regulatory permits, and obtain the social licence to operate.

Logged rock types were grouped into one of 13 lithological units. These units were then divided into four main geological domains based on lithology, alteration and grade criteria. Each domain is distinctive in mineralogical, textural and geochemical character as well as in gold distribution.

The four zones are believed to represent distinct hydrothermal events starting with the Xp_Ip domain, which is associated with late porphyry events. This was followed by the silica–(arsenopyrite)–marcasite alteration associated with hydrothermal brecciation (Xh) in the up-flow zone centred on section 3400N and “mushrooming” out below the Suárez Formation unconformity. The later-stage quartz–carbonate phase (Vn) appears to have formed in the northern section of the deposit, wrapping partially around a flexure in the feldspar porphyry contact. Xh and Vn were grouped together for resource domaining purposes.

Leapfrog and GEMS software were used to build the wireframe models representing the domains. Given the selected block size of 4 m by 10 m by 10 m, a 2 m composite was selected for grade interpolation purposes.

The Fruta del Norte Project metal capping review consisted of disintegration analysis of the composite values in conjunction with histogram, log probability, and mean variance plots. In order to preserve the grades within the high-grade zones with intense veining of domain Xh_Vn, composites were left uncapped, and instead a restricted search for gold values greater than 60.0 g/t was applied. A capping value was applied to the silver grades for this domain.

The resource database includes 3,511 density measurements. Density data were reviewed by lithology and alteration type. The average values were assigned to the block model to convert volumes to tonnes.

Variography was carried out within a 450 m long segment of the deposit with closely-spaced drilling, between northings 9,583,300N and 9,583,750N.

Grade interpolations for gold and silver were performed using the ordinary kriging algorithm and using search strategies individually adapted to each domain. The search ellipses generally have the same orientations, striking north–northeast, dipping west, and plunging north–northeast. A two-pass approach was used, with the first pass search ranges approximately equivalent to the variogram ranges at 80% of the sill. The first pass used a minimum of two drill holes. The second pass used a larger search with a one drill hole minimum. Both hard and soft boundaries were used, based on various contact analyses and the geological interpretation. Pass 1 applied a hard boundary between domains. Pass 2 used a soft boundary between domains. The interpolation parameters for silver were similar to those for gold.

Mineral Resources were classified into the Indicated or Inferred categories based on drill hole spacing and the apparent continuity of mineralization. Variography has suggested a range of 35 m at 75% of the total sill. Infill drilling in 2010 was designed at 35 m spacing. In general, areas of 35 m spacing or shorter were classified into the Indicated category. Other factors that were taken into consideration include the search distance to the nearest composite, estimation by the first pass search ellipse, visual examination and general considerations of drill fan spacings. Parts of the Xh_Vn and Xp_Ip domains were classified as Indicated Mineral Resources. All of the M_South domain was classified as Inferred Mineral Resources. Due to the lack of exposures of mineralization for inspection on the surface or underground, there are no Measured Mineral Resources.
MINERAL RESERVE ESTIMATES

Quantity and Quality of Minerals in Reserve Estimate

The resource block model was provided by RPA and consisted of density, grades, rock types (geometallurgical resource domains), resource category and other impurities.

The geotechnical block model was developed by SRK. It utilized assessments of lithology, alteration and structure to model three domains that encompassed Poor, Fair-Poor, and Good–Fair rock mass conditions. This model was built in Leapfrog.

The Mineral Reserve block model was prepared by combining the resource block model and the geotechnical block model.

The models were imported by NCL via ASCII files into DESWIK software. Validation was carried out with 99.9% of the original block model data for Indicated and Inferred Resources in terms of tonnes, gold ounces and silver ounces. The Inferred Mineral Resources grades were set to zero for the purposes of Mineral Reserves estimation.

The mining methods for the Fruta del Norte Project will be long-hole transverse stoping (TS) with paste backfill in Fair to Good ground, and drift and fill (D&F) stoping with cemented rock fill in Poor ground. Dilution was applied following the geotechnical recommendations. The shape optimizer from DESWIK was used to determine practical mining shapes. The deposit was divided into horizons that were classified both vertically and by mining method.

The dilution material for the TS primary stopes was estimated using the resource block model; dilution material for lateral stopes was assumed to be zero grade on one side and the grade from the resource block model on the other side. The total maximum dilution reaches 16.9% (sill pillar starting stope); for scheduling and reporting purposes the waste dilution is applied (a maximum of 7.7% in sill pillar lateral stopes) so as not to duplicate tonnage because of the stope arrangement. The grade dilution factor applied for TS stopes is a factor by which grades are adjusted because of dilution; in this case the waste reduces the grades because it adds no content for the following elements: gold, silver, mercury, lead, sulphur and antimony. The D&F dilution estimate includes the primary, secondary and tertiary drifts. A grade dilution factor of 95.3% was used for D&F.

Overall, in primary TS stopes, the total mining losses are estimated to be 8.8%, resulting in a mining recovery factor of 91.2%. In secondary TS stopes, the total mining losses are estimated to be 11.9%, resulting in a mining recovery factor of 88.1%. Sill pillar recovery is assumed to be 50%, and for D&F, recovery was assumed to be 100%.

The final LOMP weighted-average dilution applied in the estimation (including TS, D&F and development) is 5.63%. The final LOMP weighted-average mining recovery applied to the estimate is 90.9%.

Two different cut-off grades (COG) have been used, the breakeven COG (BECOG) and the mill COG (MCOG). The BECOG is one of the key parameters needed for mine and stope design. The estimate of BECOG considers mining, processing, royalties and overhead operating costs. The MCOG is applied after the stopes and the accesses are defined, because at this stage there could be some low-grade material that has to be mined and hauled to surface. A decision has to be made whether to send this material to the process plant or to the waste dump. If the material has sufficient grade to pay for processing and other surface costs, it is assumed to be sent to the process plant (the mining cost is considered a sunk cost). A BECOG of 4.7 g/t Au was used for TS and an elevated BECOG of 6.8 g/t Au was used for D&F. A MCOG value of 2.7 g/t Au, excluding the mining costs, was used where production development was already built.

Mineral Reserves have been classified using the 2014 CIM Definition Standards and are summarized in Table 2.

Notes:

1. The QP for the Mineral Reserve estimate is Mr. Alejandro Sepúlveda, RM CMC an NCL employee.
2. Mineral Reserves have an effective date of 30 April 2016. All Mineral Reserves in this table are Probable Mineral Reserves. No Proven Mineral Reserves were estimated.
3. Mineral Reserves were estimated using a $1,250/oz gold price. Mining cost assumptions for TS $61.0/t; mining costs for D&F stopping $80/t. Other costs and factors common to both mining methods were process and other costs $75.80/t, dilution factor of 10%, concentrate transport and treatment charges of $6.70/t. A royalty of $71.10/oz/t Au and a gold metallurgical recovery of 93.9% was assumed.
4. Gold cut-off grades were 4.7 g/t for TS and 5.3 g/t (elevated to 6.8 g/t) for the D&F.
5. Silver was not used in the estimation of cut-off grades but is recovered and contributes to the revenue stream. The average silver metallurgical recovery is 81.6%. The silver price assumption was $20/oz.
6. Tonnages are rounded to the nearest 1,000 t, gold grades are rounded to two decimal places, and silver grades are rounded to one decimal place. Tonnage and grade measurements are in metric units; contained gold and silver are reported as thousands of troy ounces.
7. Rounding as required by reporting guidelines may result in summation differences.

## Factors That May Affect the Mineral Reserve Estimate

Factors that may affect the Mineral Reserves include:

- Long-term commodity price assumptions;
- Long-term exchange rate assumptions; and
- Long-term consumables price assumptions.

Other factors that can affect the estimates include changes to the Mineral Resources input parameters, constraining stope designs, cut-off grade assumptions, geotechnical and hydrogeological factors, metallurgical and mining recovery assumptions, and the ability to control unplanned dilution.

## MINING METHODS

The following key considerations influenced the mine design:

- The Fruta del Norte Project is located in an environmentally sensitive area. Although an open pit mining method or a caving method might be possible, the subsequent impacts were assessed not to be feasible. Hence, selective underground mining was considered for the 2016 FS;
- The host rock for the deposit appears competent but the resource zone is less competent with a small portion in Poor rock (less than 10%). Geomechanically, the rock mass quality varies from Poor to Fair (RMR range 40 to 55) with the intact rock strength averaging 60 MPa. The deposit is also relatively close to surface (within 140 m of surface in some locations);
- Given the variable conditions likely to be encountered, a range of methods and or support regimes was considered appropriate for the Fruta del Norte Project. The primary methods of extraction selected are TS in the better ground conditions and D&F in the more challenging areas;
- Incorporation of backfill to reduce the risk of geotechnical failure and maximize extraction; and
• Consideration of dewatering requirements and proximity of the Machinaza River.

Geotechnical Considerations

The faults present in the 2015–2016 structural model form a complex network of west–northwest- to northeast-trending, moderate dipping to sub-vertical faults that variably truncate and offset lithology and gold mineralization. Faults generate the widest zones of gouge and breccia where they cross the Suárez Formation. In comparison, faults have well defined margins where they cross the Misahuallí Formation. The West, Central, and portions of the East Fault are significant fault structures that represent a risk to the stability of an open stoping method and subsequently these areas are considered suitable only for a limited man-entry mining method such as D&F where conditions can be well controlled.

Degradation of Suárez Formation conglomerate results in difficult mining conditions that can be mitigated through extraordinary ground support (full shotcrete lining and invert), which will be a high mining cost with slow advance rates. The mine layout has been optimized to avoid intersecting the Suárez Formation.

Stress measurements are not currently available for the Fruta del Norte Project. In the absence of this information, a stress regime based on SRK’s evaluation of the structural geological setting and the World Stress Map have been used to provide a range of estimates. The ground stress is relatively low based on the shallow depth, and rock damage due to higher mining induced stress concentrations is only anticipated in high extraction or sequence closure areas, and weaker rock mass areas. However, reduction in the mining stresses around excavations is likely to adversely affect the stability of large open span areas. Tensile failure and gravity induced unravelling are foreseen as the main failure mechanisms.

The Fruta del Norte Project deposit is in a structurally complex, clay-altered, porphyry environment, adjacent to a river. Rock mass conditions in the infrastructure and production areas vary from Poor to Fair quality (RMR 20 to 60) with the poorest conditions present within major structures that run longitudinally through and bound to the deposit. Outside of these fault areas, rock mass conditions are generally Fair (RMR 40 to 60; intact rock strength 50 to 70 MPa); however, localized zones of Poor ground potentially associated with secondary structures or locally elevated alteration intensity are present throughout the planned mining area.

Excavation stability assessments were completed using industry-accepted empirical relationships, with reference to analogue operational mines where possible. The rock mass conditions in the Poor to Fair and Good domains are considered suitable for open stoping mining methods. The ground conditions within the Poor domain (and crown pillar area) are considered suitable only for a limited man-entry method.

Ground support design considers industry-standard empirical guidelines and SRK’s experience in variable ground conditions. Compromises have been made in the extraction sequence as a result of the need to balance grade and production profiles, extraction of wide orebody areas, and other geotechnical constraints. Ultimately several aspects of the sequence may not be geotechnically optimal, and additional design may be required.

Groundwater

Groundwater is expected to inflow into the underground mine from the fractured bedrock around the mine itself and from geological structures. The total groundwater inflow will not be large compared with many other mines around the world and could be dealt with by in-mine pumping, but the combination of the water with poor ground conditions and the mining methods could have an influence on mining productivity. Rock within the mining area is potentially acid-generating; hence, water that flows through the mine is assumed to need treatment before being discharged to the environment.

Groundwater inflow risks and potential effects will be managed in multiple ways, including cover and probe drilling, localized grouting, dewatering wells, and underground drainage galleries. As mine development proceeds, the
groundwater system will start to drain down, but since the geological units only have moderate hydraulic conductivity and flow will be fracture controlled, it is expected that drainage performance will be highly variable over different parts of the mine. The combination of dewatering wells and drainage galleries with drain holes provides flexibility and some degree of redundancy to reduce the risk of areas not being sufficiently dewatered prior to production mining.

Water Management

All the water flow generated in the mine (infiltrated, industrial and paste fill water) will be managed in a single dewatering system. The system assumes that water flows running on ramps, declines and drifts are collected by gravity in a sump on each production level. Where gravity flow is not possible, a sump pump will be used to conduct water to the sumps.

Mine Designs

SRK recommended TS where there is no Poor domain rock quality. The recommended dimensions for TS are 12 m wide x 20 m long x 25 m high.

For excavations within the Poor ground a D&F method is recommended. Dimensions for this method are 4.0 m wide x 4.0 m high.

The crown pillar will be from the 1240 L (south area of the mine) to the 1270L (north area of the mine). Because of instability risk associated mainly with the rock quality, the mining method for these areas will be D&F.

A sill pillar was included between the TS horizons 1080L and 1170L at 1155L, which allows for earlier production. The mining method for this sill pillar will be TS with a stope height of 15 m (instead of the 25 m to be used in the regular stopes).

The twin declines will use a spiral to gain depth to maximize the distance from the surface, so that a vertical distance of approximately 155 m below the Machinaza River can be obtained. The mine ramp will be located central to, and will be approximately 50 m offset from, the main workings to the east of the deposit. The ramp configuration will enable haulage trucks to achieve higher average haul speeds and maintain safety standards. The ramp will be developed nominally at a 15% gradient.

Levels will be developed to access the strike extents of the deposit and connect the development to the return air raise (RAR in the north) and fresh air raise (FAR in the south) in order to establish flow-through ventilation.

Stope cross-cuts are required to access sill development from the haulage drifts, as well as connecting sill development within a given stope line separated by waste. Development will be centrally located within a given stope. The top development in a stope will initially serve as the drill horizon for the stope below, and then as the mucking horizon for the stope above. The bottom development in a stope will serve as the mucking horizon for the stope above.

Mine Operating Assumptions

An experienced, qualified mining contractor is planned to develop the declines. Contract mining will continue until the critical underground infrastructure has been constructed. The contractor will then demobilize. There will be a transition period as Owner mining equipment is introduced when access to additional ventilation and the mineralized zone is reached. Owner mining will eventually operate both development and production equipment.
Ventilation

The ventilation system proposed is a mechanical exhaust ventilation system (pull) where fresh air will enter by suction. The mine ventilation system was proposed to consist of the FAR and RAR. The raises would have a diameter of 5 m; the RAR would have an overall length of 290 m, and the FAR would have an overall length of 345 m. The remaining sections of the mine ventilation system would consist of the two declines, the mine ramp and the internal raises connecting levels.

Production Plan

Criteria and assumptions used in preparing the production plan include:

- The production plan has been developed on a monthly basis from Year 2017 to Year 2022 and annually thereafter;
- The mine will operate 360 d/a with five days allowed for delays due to weather conditions;
- The plant is scheduled to operate 365 d/a;
- Production will be a combination of TS and D&F methods; and
- The process plant is designed to treat 3,500 t/d.

Backfill

The following backfill capacities and strength targets were set:

- The paste plant has been designed to cater for a nominal throughput of 70 m³/h and will operate at an average utilization rate of approximately 60%;
- The nominal design production rate of the CRF plant is 180 m³/h;
- Main pour target strength of 300 kPa after 14 days with a plug pour target strength of 434 kPa after three days; and
- CRF target strength of 3 MPa to 5 MPa after seven days.

The paste plant will be a batch-type backfill plant. All tailings leaving the process plant will be thickened to about 55% solids. When no paste fill is required underground, the entire tailings stream will be pumped to the TSF. When paste fill is scheduled for underground, approximately half of the tailings stream will be pumped 3.4 km to the paste plant for further dewatering. Excess process water will be pumped back from the paste plant to the process plant using a second pipeline.

Underground Infrastructure Facilities and Services

It is proposed to keep material handling as simple as possible, relying on mobile equipment for transport instead of permanent infrastructure and facilities. Minimal storage will be developed underground. Haul trucks will be repaired in a surface maintenance facility. Load–haul–dump vehicles (LHDs), drills, explosive carriers and scissor trucks will be repaired/maintained underground or driven/hauled to the surface shop for major work. Most of the mobile equipment, trucks and LHDs, and vehicles parked on surface will be fuelled from the surface facility. The rest of the fleet will be fuelled by the fuel/service vehicles or at the underground service facility. The radio communication system is based on laying leaky cable feeder antenna. A fibre-optic network will provide a communication highway for control systems and data management inside the mine. The air compressor system will consist of two compressors in operation and one on standby. Explosive and detonator magazines will be located on a selected level underground.

Mining Equipment

Mine operations will use the same equipment for development for TS and for D&F. Drilling, support, loading and hauling equipment are the same for both methods. Different equipment is required for loading for production because TS is 5 m wide x 5 m high and D&F is only 4 m wide x 4 m high. A maximum of four 10 yd³ LHDs, four 12 yd³
LHDs and nine 45 t trucks will be required for production and development. Additional equipment will include a rammer-jammer, jumbos and explosive loaders. Support equipment will include a scissor lift, crew and rescue vehicles, shotcrete sprayer and transmixer, jacklegs, scaler, boom truck, telehandler, core drill, Kubota tractors, rock breaker, dozer, grader, fuel and lube truck, and a front-end loader.

Mine Waste Stockpile Design

As part of the underground development at the Fruta del Norte Project approximately 2.03 Mt of waste material will be generated. Of this, approximately 1.29 Mt (64%) will be returned underground as part of the backfill management strategy. The remaining 0.74 Mt of material will need to be permanently stored on surface. An area to the south of the process plant has been allocated to accommodate waste from the underground mine. Two different types of waste will be produced:
- Potentially acid rock drainage or potentially acid generating; and
- Non-potentially acid generating.

Ore and Low Grade Stockpiles

There are three types of stockpiled material based on grade:
- High grade (>7 g/t Au): almost never stockpiled;
- Medium grade (4.7 g/t Au to 7 g/t Au): maximum 30,000 t; and
- Low grade (2.7 g/t Au to 4.7 g/t Au): maximum 170,000 t late in the mine life (Year 2033).

The area allocated for these stockpiles is close to the crusher station at the process plant. Stockpiled material will be consumed by the time the mine closes.

PROCESSING AND RECOVERY OPERATIONS

Recovery Methods

The Fruta del Norte Project process plant feed will contain gold in the following forms:
- Fine free gold;
- Coarse free gold;
- Gold contained in sulphides (refractory); and
- Gold contained in other forms (e.g. silicates).

The GFL flowsheet was selected for the Fruta del Norte Project because of the nature of the gold in the plant feed. The up-front gravity circuit is essential to recover the coarse free gold and small amounts of fine free gold. The gravity circuit will reduce spikes in coarse gold content in the feed, ensuring that the flotation feed grade stays relatively uniform. The flotation circuit is capable of recovering the gold associated in sulphides (pyrite). The flotation circuit will reduce spikes in sulphide gold grade and provide a consistent feed to the CIL circuit. Typically, CIL circuits function best on a uniform feed; this can be provided by the combined gravity and the flotation circuits.

Run-of-mine (ROM) ore will be transported to ROM stockpiles. Feed will be reclaimed from the pile, transferred to an apron feeder, processed through a jaw crusher and the product conveyed to the coarse ore stockpile. Ore will be recovered from the stockpile to feed the primary SAG mill. Oversize from the SAG mill discharge screen will be recycled back to the SAG feed. The SAG circuit product will be fed to a cyclone cluster which will be in closed circuit with the gravity concentrators and ball mill. Oversize from the gravity concentrator feed screen will be fed into the ball mill discharge which is pumped to the cyclone feed. Undersize will feed the gravity concentrators. Gravity concentrate will report to the intensive leach reactor and the gravity concentrator tailings will return to the cyclone feed.
The intensive leach reactor (ILR) will produce pregnant solution, which will be directed to electro-winning cells to produce a gold–silver precipitate. After washing, the barren slurry will report to the flotation regrind circuit.

The overflow from the grinding cyclones will report to the flotation circuit. The flotation circuit will consist of three stages of flotation and regrind. Rougher and scavenger concentrate combined with ILR barren slurry will be directed to a regrind mill in closed circuit with a cyclone cluster. Final concentrate from the third cleaning stage of the flotation circuit will be thickened, filtered and bagged as product. Overflow from the concentrate thickener will be recycled to the process water tank.

Flotation tailings will be thickened and then report to the leach circuit while the thickener overflow will be recycled to the process water tank. The thickener underflow slurry will continue through pH conditioning before reporting to a series of CIL tanks where the slurry is leached with cyanide. Discharge from the leach train will report to cyanide destruction.

The loaded carbon generated from the CIL tanks will be pumped to the carbon elution and regeneration circuit. Once gold has been eluted, the carbon will be sent to regeneration. After quenching and screening to remove small particles, the reactivated carbon will be reintroduced to the CIL circuit.

Gold eluate will be sent to electro-winning cells using stainless steel cathodes to produce a gold–silver sludge. This is combined with sludge from the separate ILR electro-winning cell, filtered and dried. It is then mixed with fluxes and smelted to produce gold-silver doré.

Slurry discharged from the CIL tanks will report to cyanide destruction. A two-stage Inco SO2/air process will be employed with the addition of lime. Sulphur dioxide will be provided as sodium metabisulphite. Slurry discharged from cyanide destruction will report to the tailings thickener. Underflow from the thickener will be sent to the tailings storage facility (TSF) and/or the paste backfill plant. Overflow from the thickener will be recycled back to the process water tank.

The process control system (PCS) will have redundancy and will allow dependable, simple and effective control of the plant processes. The PCS will monitor and act over continuous analogue loops, on/off valves, motors, variable frequency drives and programmable logic controllers. The PCS will also signal alarms for abnormal conditions and store process data.

An in-house maintenance crew will maintain the surface operation areas. The maintenance team will be shared by the surface operations areas including the process plant, paste backfill plant, cemented rock fill plant, water treatment plants, tailings storage facility and operations buildings.

The concentrate production rate is expected to be 140 t/d at a feed rate of 3,500 t/d. The actual concentrate quality could vary from month to month based on ore variability, mine planning and sequencing as well as the geometallurgy.

The total gold expected to be produced as doré varies from 90 koz to 145 koz per year during steady state and is 1,323 koz during the LOM. The doré is expected to contain above 98% precious metals with the remainder made up of base metals and impurities. The precious metals portion is expected to contain approximately 70% gold and 30% silver.
INFRASTRUCTURE, PERMITTING AND COMPLIANCE ACTIVITIES:

INFRASTRUCTURE AND LOGISTIC REQUIREMENTS FOR THE FRUTA DEL NORTE PROJECT

Access

The planned route to access the Fruta del Norte Project site is by the Troncal Amazonica road to Los Encuentros and from this point to the Fruta del Norte Project site by a new main access road (a section of public road near the El Pindal village, and another section of road through the Ecuadorean jungle).

The main port for international cargo arrival will be Guayaquil.

On-site Infrastructure

On-site non-process services such as the maintenance shops, offices, warehouse, camp, greenhouse, sewage treatment plants and mobile equipment will support the operation. There will be fresh water, domestic water and process water systems and a fire detection and protection system. The utilities and services include compressed air supply and distribution, control systems, closed circuit television system, supervisory control and data acquisition system, waste management systems and fuel storage and distribution. Mobile equipment for maintenance, operations services and transportation includes tractors and loaders for stockpile rehandling, mobile cranes, buses and utility vehicles.

Camps and Accommodation

At the Technical Report effective date, the camp facilities were to be built along the Project access road. Since then, the Company determined that the camp facilities will be located close to the existing Las Peñas camp, at an altitude below 1,500 masl. The camp will have a peak accommodations capacity of approximately 1,000 persons. The existing Las Peñas exploration camp will be expanded to about a capacity of about 700 persons and will be used for both exploration and construction.

Aggregate Source

At the Technical Report effective date, it was proposed that Lundin Gold would exploit the Hollín Borrow Pit to provide aggregate materials for construction and mine backfill, from construction through to mine closure. Since then, the Company has undertaken a re-evaluation of the plan to mine materials from the Hollín Borrow Pit and has selected an alternative location closer to existing infrastructure. In addition, testwork of the new source of aggregate has shown that it will be of a higher quality. The source is called the Mountain Pass Quarry.

Tailings Storage Facility

The facility will be located in the uppermost portion of the valley, to minimize the catchment area and to maximize the separation distance from the Zarza River downstream. The tailings dam will be an earth-and-rock-fill structure constructed with a maximum dam height of 63 m measured at the dam centre line. The ultimate dam will have a crest width of 6 m and a length of 700 m at final grade. A starter dam will be initially constructed to store start-up water for the mill and create sufficient storage for the tailings in the first year of operation, and to safely contain the probable maximum flood (PMF). The TSF dam will be raised continuously throughout the service life until reaching the ultimate elevation. Each dam raise will be completed at least one year before the maximum tailings pond elevation required each year; currently dam raises are contemplated at Years 0, 2, 5, 10 and 14 (ultimate). A total of 12.15 Mt of GFL tailings will be pumped to the TSF at 55% solids over the mine life. Excess water will be reclaimed to the mill by a floating barge. The sludge produced from the treatment of contact water from the mine at the water
treatment plant (WTP) will be delivered at a rate of 4 m³/h and stored in the TSF. Sediments removed from ponds located in the mine infrastructure area will also be stored in the TSF and will be delivered at a rate of 8 m³/h. The TSF design incorporates sufficient dam freeboard at all times during operations to accommodate the sloping tailings beach and to contain the PMF and any excess water volumes in the tailings basin without discharge. Diversions will be constructed on the east side of the TSF catchment to divert non-contact water. These channels will be lined to limit erosion and are designed to convey peak catchment runoff from the 1:100 year storm event.

Off-site Facilities

In order to reduce the impact of the Fruta del Norte Project footprint, some support facilities may be located off the main project site. Lundin Gold has also established an administration office in Quito and a community relations and community office in Los Encuentros. These existing offices provide administrative support to the Fruta del Norte Project.

Power

The Ecuadorian electrical system is based on a high quality electricity service matrix, the distribution system is called the Sistema Nacional de Distribución (SND, National Distribution System). The SND is controlled by CELEC EP Transelectric, a government institution in charge of power transmission and distribution. The Fruta del Norte Project site is located within the supply concession area of the Empresa de Energía Regional del Sur (EERSA, Regional Electric Company of the South). Lundin Gold is participating in a public infrastructure investment to reinforce the SND matrix in the area and will be contributing financially to the installation costs of the transmission line between Taday and Bomboiza.

As of the date of this AIF, the contract for the transmission line has been awarded to Cointec S.A. Ingenieros Contratistas and Energía y Petróleos Enerpetrol, S.A. A 42.6 km single-circuit, 230 kV dedicated transmission line will be built from the Bomboiza substation to FDN. The transmission line will connect to a new substation that will be built at the Project site, near the process plant. This substation will step down the power to 13.8 kV and distribute power throughout the Project site at that voltage.

Communications

The communications system for the Fruta del Norte Project will consist of a fibre-optic network infrastructure, telephony system, radio communications, mobile telephony, and satellite communications. The data management system will be connected to the communications systems.

ENVIRONMENTAL, PERMITTING AND SOCIAL CONSIDERATIONS

Baseline Studies

The physical (abiotic), biotic, social, economic, and cultural baseline has been characterized for the Fruta del Norte Project using primary information gathered in the field, and secondary information from official sources such as Government records. Field studies and data gathering for the baseline studies were undertaken between 2008 and 2016.

Waste Management

The waste management centre (WMC) was sized to receive waste during operations and manage the waste temporarily until final disposal by an authorized contractor.
**Water Management**

Four main types of water will need to be managed during construction and operations:

- **Non-contact water:** Water (either runoff from precipitation or flowing in natural streams) whose quality is not impacted by the Fruta del Norte Project infrastructure and activities;
- **Unaffected contact water:** Water that is likely to have had a sediment load increase but not subject to chemical/biological impact requiring treatment other than total suspended solids (TSS) removal in order to meet water quality regulations requires TSS removal only, prior to discharge to a natural water course; no water treatment plant is required;
- **Affected contact water:** Water that must be sent to a water management pond and a water treatment plant prior to being discharged to the environment; and
- **Neutral water:** Groundwater collected above the orebody at the underground mine requires TSS removal and/or primary treatment only (depending on the quality parameters) prior to being discharged.

Four water treatment plants are planned, and will include:

- Two domestic water treatment plants: one will be located at the camp site and the other at the process plant;
- Sewage treatment plants will be located at the camp site and portals area facilities. Remote or unconnected facility sewage will be managed using septic tanks and trucked to treatment plants; and,
- A main effluent water treatment plant that will be located at the process plant site and will treat the affected contact water from the site;

Four water management work types are proposed:

- **Diversion works:** To divert non-contact storm water to prevent it from reaching the site during the construction and operations phases of the Fruta del Norte Project. These comprise riprap interception works, lined channels and creek riprap discharge works. They also include slope drainage systems for mass earthworks;
- **Contact water works:** To manage affected and unaffected water during the construction and operations phases. These comprise sumps, water management ponds, chutes (steep slope conduits), energy dissipaters, water treatment plants, pumping systems and emergency discharge works to natural water courses;
- **Neutral water works:** To deal with groundwater from the dewatering wells above the deposit. These comprise a pumping system, a water management pond and a discharge to the Machinaza River; and
- **Secondary and minor drainage networks:** To be located within the facilities for non-contact and contact water, including small sumps, downspouts, and minor collecting pipes. These works have not been designed at the feasibility level.

A water balance model and a water quality model were developed in support of a water management plan (**WMP**) for the site:

- The purpose of the site-wide water balance model was to simulate the water management plan for the mine site. The model tracks water from the sources, through collection and conveyance systems, usage, storage, treatment and discharge to the environment. The results of the water balance model demonstrate that the proposed water management plan at the site is feasible; and
- The purpose of the site-wide water quality model was to simulate the water quality elements of the project, identifying sources of loading, assessing the mixing of different inflows and estimating the resulting water quality concentrations in each flow. The water quality results determined which water flows met discharge requirements and which flows did not meet discharge requirements and will require water treatment. Water quality parameters requiring treatment in each flow component were identified. The water quality model focused on parameters of concern identified from the surface water quality assessment (aluminium, arsenic, copper, cobalt, cyanide, iron, magnesium, potassium, manganese, lead, selenium and zinc) as well as sulphate and total dissolved solids. The results of the water quality model demonstrate that the
proposed WMP for the site is feasible and will meet regulatory requirements for discharge to the receiving water bodies.

The general purpose of the WMP was to outline an integrated water management strategy to be followed at the Fruta del Norte site during the design, construction, and operations phases, and to demonstrate a feasible, rational, sustainable, and environmentally-friendly plan to deal with both surface water and groundwater.

Closure Plan

Closure planning has been undertaken to a conceptual level and will be continually updated throughout the Fruta del Norte Project life. The conceptual Closure Plan has been developed in accordance with Article 125 of the Ecuadorian Environmental Regulations for Mining Activities (RAAM) and Title X of the Mining Safety Regulations. The closure activities will cover closure aspects related to environmental factors such as soil, air and water that are directly related to the community health and safety. Aspects related to economic and cultural dynamics of the communities have not been considered in the current conceptual plan. The definitive Closure Plan must be presented two years prior to cessation of operations. Under RAAM, mine closure monitoring should last for at least five years after the mining operations are complete. According to the Technical Report, the closure cost estimate in the conceptual Closure Plan is $28.8 million.

Permitting

Permitting requirements were evaluated by project phase, including before construction (16 permits), the most important being the updated Environmental Licence, during construction (six permits), and before operations (three permits). The Environmental Design Criteria, updated through October 2015, are based on Ecuadorian law, quality criteria and regulations, as well as international standards such as those issued by the International Finance Corporation, the World Bank, the World Health Organization, the International Cyanide Management Code, the International Network on Acid Prevention, and the International Council of Mining and Metals.

Social Considerations

The Fruta del Norte Project’s indirect influence is expected to extend to some neighbouring communities, including the parish of Los Encuentros and two communities from neighbouring parishes. Los Encuentros is a rural parish located in Yantzaza county, characterized by the existence of one main population centre (the parish seat and home of the parish government) where the population has consolidated. There are also several scattered population centres, known as communities, neighborhoods and sectors. Some cultural sites have been recorded in the study area, but the Fruta del Norte Project is not expected to impact any cultural heritage, and strict archaeological protocols are in place in consultation with the National Cultural Patrimony Institute. Although perceptions of artisanal mining are low, the community is very supportive of the Fruta del Norte Project, and the primary concern is access to employment. There is currently no large-scale mining in Ecuador. A community relations program has been defined based on the Community Development Support Program (PADC, Plan de Apoyo a Desarrollo de la Comunidad) which seeks to implement corporate responsibility strategies, to maintain a social licence with the communities, and to comply with socio-environmental legislation applicable to AESA’s operations. The PADC is based on the principles of community participation, sustainable development and human development.

CAPITAL AND OPERATING COSTS AS AT TECHNICAL REPORT EFFECTIVE DATE

CAPITAL COST ESTIMATES

The methodology used in the development of the capital cost estimate and the level of engineering definition result in the estimate having an accuracy of ±10% to ±15% including the contingency based on the 80% confidence level. The estimate combined inputs from Amec Foster Wheeler, KCB, Lundin Gold, NCL, and Paterson and Cooke (P&C).
The cost estimate was divided into capital costs (direct, indirect and Owner’s costs, and contingency) and sustaining and closure costs:

- **Direct costs**: costs for productive works and permanent infrastructure. Includes productive infrastructure, services and equipment required for the extractive process;
- **Indirect costs**: costs needed to support the construction of the facilities included in the direct costs. Includes EPCM services, EPCM temporary facilities (infrastructure) and construction management, construction camp and associated services, capital spare parts, freight and logistics;
- **Owner’s costs**: costs associated with Lundin Gold’s project administration, geological studies, support infrastructure, safety and environmental, community relations, administration and finance, human resources and others;
- **Contingency**: includes variations in quantities, differences between estimated and actual equipment and material prices, labour costs and site-specific conditions. Also accounts for variation resulting from uncertainties that are clarified during detail engineering, when basic engineering designs and specifications are finalized;
- **Capital expenditures after the start of operations** include costs for the tailings dam wall growth, mine and other equipment replacement and the paste fill plant, plus closure costs. These costs are included in the financial analysis in the year in which they are incurred. The capital cost estimate includes construction activity costs to Q1 2020. Costs after this are classified as sustaining capital; and
- **Closure costs**.

The initial Implementation Phase capital cost, as displayed in Table 3, is estimated to be $668.7 million. The sustaining capital is estimated to be $291.9 million.

**OPERATING COST ESTIMATES**

The operating cost estimate in the Technical Report was based on Q1 2016 assumptions. The estimate combined inputs from Amec Foster Wheeler, KCB, Lundin Gold, NCL, and P&C, and has an overall accuracy of ±10%. The operating cost estimate is inclusive of site costs during the operational period (commencing once the commissioning with load/performance testing certificates are signed) until site closure. Variable costs were based on a mine plan
provided by NCL. The overall LOM operating cost estimate is $118/t, and includes base costs, non-recoverable taxes and leasing. Operating costs are estimated at $414/oz Au, including all site costs. Mining costs are the greatest contributors to the overall operating cost, followed, in order of contribution, by process, general and administrative (G&A) and surface infrastructure costs, as displayed in Table 4.

**ECONOMIC ANALYSIS**

The Fruta del Norte Project has been evaluated using a discounted cash flow analysis. Cash inflows consist of annual revenue projections. Cash outflows include capital expenditures (including the three years of pre-production costs), operating costs, taxes, and royalties. These are subtracted from the inflows to arrive at the annual cash flow projections. Cash flows are taken to occur at the midpoint of each period.

To reflect the time value of money, annual net cash flow projections are discounted back to the Fruta del Norte Project valuation date using 5% to produce the base case. The discount rate appropriate to a specific project depends on many factors, including the type of commodity; and the level of project risks (e.g. market risk, technical risk and political risk). The discounted, present values of the cash flows are summed to arrive at the Fruta del Norte Project’s net present value (NPV).

In addition to the NPV, the IRR and the payback period are also calculated. The IRR is defined as the discount rate that results in an NPV equal to zero. The payback period is calculated as the time required to achieve positive cumulative cash flow for the Fruta del Norte Project.
The financial model includes consideration of metal prices, transport costs, royalties and taxes, and working capital. An amount of $430 million of historical costs is considered in the financial model. These historical costs provide a shield against taxes and profit-sharing expenses.

The after-tax NPV at a 5% discount rate over the estimated mine life is $676 million. The after-tax IRR is 15.7%. The after-tax payback of the initial capital investment is estimated to occur 4.5 years after the start of production. A summary of the financial analysis is presented in Table 7, with the base case discount rate highlighted. The life of mine all-in sustaining cost (AISC) per ounce of gold is $623.

Sensitivity Analysis

A sensitivity analysis was performed on the base case NPV after taxes to examine the sensitivity to gold price, operating costs, capital costs and labour costs. In the pre-tax and after-tax evaluations, the Fruta del Norte Project is most sensitive to changes in gold price, less sensitive to changes in operating costs, and least sensitive to capital cost and labour cost changes. Figure 1 shows the results of the after-tax analysis. The gold grade is not presented in the sensitivity graph because the impact of changes in the gold grade mirrors the impact of changes in the gold price.

**Execution Plan as at Technical Report Effective Date**

The Fruta del Norte Project schedule entails significant project activity durations, some of which may run concurrently, including a duration of 11 months for the engineering, procurement, contracting and preliminary construction of Early Works, 12 months for the construction of the access road and bridge over the Zamora River,
34 months for construction of the twin declines, six months to develop the aggregate borrow pit and plant, nine months for the mass earthworks and 20 months for the construction of the process plant and facilities.

The implementation strategy for the Fruta del Norte Project is dictated by the duration of the construction of the twin declines, which will provide access to the deposit; the estimated duration for this construction is 34 months. It is possible to build all the surface facilities including the process plant and associated infrastructure during this period. Therefore, the construction of the mine access is the critical path and the Early Works to expedite the construction of the access are also critical. The objective of the Early Works is to build access and platforms for the start of construction of the portals and declines, and to provide support facilities. The Early Works have been given special attention in the execution plan because they will need to start very soon after approval of the 2016 FS, if the proposed project schedule is to be met.
MINERAL EXPLORATION

As of the date of this AIF, Lundin Gold’s properties in Ecuador consist of 30 metallic mining concessions and three construction material concessions. The Company also has four concessions in the process of renouncement. The Company’s total current concession area covers approximately 64,786 hectares. These concessions are currently registered in the name of the Company’s subsidiaries; AESA holds those concessions related to the development of FDN, including La Zarza, Colibri 2, Colibri 4, Colibri 5, Rio La Zarza 1, Valle del Inca 2 and Condesa covering an area of approximately 5,566 hectares. The remaining concessions are held by AMSA (18) and Surnorte (8).

The map below shows the Company’s holdings, as at the date of this AIF.
AMSA’S CONCESSIONS

AMSA holds an aggregate of 18 metallic mining concessions as the large block surrounding the Fruta del Norte deposit. AMSA’s Concessions are subject to the B&A Royalty.

Significant drilling has been undertaken in the FDN region pre and post FDN discovery in 2006. The Las Peñas structural corridor and the Suarez basin have been the primary focus for exploration with several targets drilled in the La Zarza concession dating as far back as 1996.

Following the discovery of FDN, exploration continued to focus in the Las Peñas structural belt, more specifically in the La Zarza, Princesa, Sachavaca and Colibri concessions where epithermal and possibly mesothermal systems were targeted. Additionally, although historically not a principal commodity focus of Kinross or Aurelian, stand-alone, porphyry-hosted deposits, both associated with and proximal to the Las Peñas belt, provide secondary tier objectives for future exploration programs.

Since acquiring Aurelian in 2014, Lundin Gold has focused its exploration efforts almost entirely on key exploration targets outside of the La Zarza concession. Lundin Gold exploration activities in 2015 included prioritizing exploration targets, geophysical surveys (IP, heli-mag and ZTEM), detailed prospecting and mapping of known targets, and initial exploration of concessions with favourable geology but little data. The principal objective was to better rank and define key targets and prepare these for drilling in 2016. The most prospective epithermal targets outside of the La Zarza concession were considered to be the Emperador, Robles, Chanchito, El Arco, and Rio Blanco targets.

Geophysical IP surveys conducted in 2015 (Gradient Array and Pole – Dipole) over previously defined soil geochemical anomalies greatly helped in defining structural context of individual targets as well as identifying resistivity and chargeability anomalies coincident with surface geochemistry. Additional geological mapping and prospecting combined with the previous IP surveys provided key information to optimize future drilling campaigns and improve confidence in the targets. Siliceous sinter (much like the one at FDN) was found in outcrop over the Emperador target indicating its location in the upper-most levels of an epithermal system.

In 2016, Lundin Gold continued exploration activities on some of its higher priority concessions, including mapping, geochemical sampling and ground geophysical (IP) surveys. Drilling was conducted on five key targets located 10 to 15 km south of the Fruta del Norte Project, with 28 holes drilled on the Rio Blanco (El Puma), Emperador, Robles, El Arco and Chanchito targets for a total of 8,519m.

Although intersected mineralization did not return high grades over significant intersections, the styles of alteration and mineralization confirms important epithermal systems at four of the five targets tested, which justified future follow-up work.

The Rio Blanco target (now named El Puma) was highly anomalous in arsenic, moly, and antimony, while the Chanchito target was highly anomalous in silica, mercury and moly. The Robles and Emperador targets were rich in all the previous elements as well as anomalous in gold and silver. Illite alteration was the dominant alteration associated with the mineralized zones. These represent the full suite of trace pathfinder elements and hydrothermal alteration which characterize the Fruta del Norte Project like many other low to intermediate sulphidation epithermal deposits.

A detailed review of the Rio Blanco drill holes, and follow-up mapping of the area showed that the Suarez Pull-Apart Basin (hosting FDN) extends much further south than previously believed. The length of the basin has now been extended to 16km (double the previous) with excellent targets, including favorable geochemistry, occurring at
numerous targets along its margins. These FDN-like targets include Alejandro, El Copal, La Negra, Puente-Princesa, Barbasco and El Puma (Rio Blanco).

Other field programs continued including Geophysical Induced Polarity (completed in December 2016), soil geochemical surveys, detailed mapping and prospection on new areas of interest to define high priority targets for drilling. So far three new significant targets have been found outside of the pull-apart basin area including Gata Salvaje, Oso Manso, and Las Nubes in the RGM Block (Reina, Guacamayo, and Marquesa concessions). These include Epithermal Au-Ag, Au-Skarn, and potential Porphyry Cu-Au systems, strengthening our firm belief in the exploration potential of our extensive land package.

In 2017, the Company’s exploration activities were focused on advancing targets to the scout drill testing stage. The El Puma, Barbasco and Fruta del Norte SW Epithermal gold-silver targets within the Suarez pull-apart basin were better defined; while outside of the basin, the Gata Salvaje, Las Nubes, and El Quimi targets were also advanced. Diamond drilling began on the El Puma target in late 2017, located approximately 12 kilometers south of FDN, and continuing into 2018. Soil sampling and two drill holes completed during the Company’s 2016 exploration drilling campaign indicated that El Puma has a similar epithermal geochemical signature to the Fruta del Norte Project deposit.

A helicopter ZTEM (Z-Tipper Axis Electromagnetic) resistivity geophysical survey of the Suarez pull-apart basin and surrounding terrain was completed in December 2017. This system utilizes the Earth’s natural electromagnetic fields and can be used to map large, deeply buried targets and structures. The results have aided the interpretation of the basin structure and depths as well as potentially identifying epithermal and/or porphyry alteration within and below the basin sediments.

Drilling was completed at the El Puma target in early 2018, with a total of 6,245m in six drill holes. A buried vein, breccia and shear hosted epithermal quartz-carbonate-sulfide system was intersected along the interpreted western edge of the basin. Assays received from the drilling are variably anomalous in the epithermal pathfinder elements silver, arsenic, antimony, lead and zinc but not significantly anomalous in gold.

In 2018 the Company, through mapping and geochemical sampling, continued to advance key targets to drill readiness stage. Exploration at the Barbasco target located on the eastern edge of the Suarez basin approximately 6km south of Fruta del Norte has defined an extensive area of anomalous epithermal pathfinder elements (arsenic and antimony) in soil samples. An outcrop containing an epithermal quartz vein (20cm true width) has been located in the andesites along the edge of this target and has assayed up to 10.4 g/t Au. A number of other small (cm scale) veins have also been identified and are interpreted to be a very late mineralization phase that postdates the basin sediment and late (Fruta) andesites. The target is for a buried FDN-type epithermal gold-silver mineralised system that may occur below the basin sediments.

Drill permitting is in process for a number of high priority epithermal gold-silver targets within and on the margins of the Suarez basin. Mapping and geochemical sampling is planned to continue in 2020 and, at the same time, the Company will work to improve its knowledge of FDN in order to define high quality brown field targets near FDN and within the Suarez Pull-Apart Basin for drilling.

All of the Company’s exploration technical information is obtained, verified and compiled under a formal QA/QC program in Ecuador. The following details the protocols used by Lundin Gold’s staff and consultants, which largely follows procedures and processes previously implemented by Aurelian and Kinross for the FDN deposit. These have been updated to include recommendations by third party consultants over the years and to meet standard industry best-practices. They apply most importantly to drilling but also as described to samples for surface geochemistry and prospecting.
Sampling Method and Approach

Drill core boxes are marked with hole number and depth at the drill site, then delivered to the Las Peñas camp in closed core boxes where the core is labelled, photographed, logged and sampled under the supervision of FDN staff geologists. Data is recorded directly into the database using iPads and includes rock quality designation (RQD), recovery, hardness estimate, structure, lithology, texture, alteration, mineral assemblage, visual estimate of visible gold abundance and intensity, and level of oxidation/weathering. Log sheets are also used to record basic drill hole data including collar coordinates, core size and depth, drilling dates and sample number series. Occurrences of visible gold is marked on the core using wax crayons. Down hole survey data is recorded digitally and downloaded directly to the database.

After the geologists mark out the sample intervals, drill core is split along the long axis using an electrically-powered bench saw. Occasionally, when necessary, areas of very soft rock (clay) are cut using a machete and sections of very broken core are sampled using spoons. The following standard sampling procedures are employed:

- Normal core intervals are 1m in mineralized intervals (+/-0.1m) and 2m in non-mineralized intervals (+/-0.1m), although these can be modified by geologist to cut intervals at lithological or mineralization contacts. Sample intervals are a minimum of 0.2m in length.
- Sample numbers are marked by geologist on the core as well as on the core boxes.
- The right hand side of the core is always sampled.
- After cutting, half the core is placed in a new plastic sample bag and half is returned to the core box.
- Between each sample, the core saw and sampling table areas are washed to ensure there is no contamination between samples.
- After cutting samples containing visible gold, a piece of quartz sandstone is partially cut to clean the diamond blade.
- Samples are clearly and securely bagged and tagged and quality control (QC) samples inserted into the sequence.
- Batches of approximately ten samples are packed in plastic buckets (drill core samples) or in poly-weave sacks (surface samples) for ground shipment to ALS, Quito for eventual sample preparation.
- Sample shipment batches are grouped together where possible in groups of 75 samples including QA/QC samples, reflecting the number of client samples that can go into the fire assay oven in one batch.
- No sample preparation (crushing or pulverization) or sample analysis is conducted by Lundin Gold staff.
- A detailed procedure (Protocolo de Aseguriameinto y Control de Calidad) regarding sampling and QAQC for drilling has been prepared by Lundin Gold and has been implemented on-site.

Previously, most data were originally recorded as hard copy. Since late 2015 geological data is directly entered into the database using iPads. Technicians later enter the following information into the database: sample number, sequence, interval, QA/QC data and other geological information such as collar information, depth of drill size reduction, date, and drill company details. Basic database checks are also carried out by the database administrator as well as the implemented system to assure the integrity of the database.
**Sample Preparation**

**ALS – Quito, Ecuador**

ALS Quito is accredited to ISO 9001:2008 for its quality management system. This laboratory is used for preparation of samples for:

- Exploration Drilling
- Geochemical Sampling (Rocks, Soils, & Streams Sediments)

**Procedure:**

- Oven dry the sample on steel trays (<80°C)
- Crush entire sample to better than 70% passing -2 mm or 10 mesh
- Clean Crusher with air gun between all samples and with quartz flush between every 10 samples as a minimum. This frequency can be increased for specific intervals if high grades are expected.
- Riffle split 300 g
- Pulverize split to better than 85% passing -75 microns or 200 mesh
- Clean pulverizers with an air gun between samples
- 150 g pulps sent in kraft bags by prep lab to analytical labs in Lima for analysis

**Sample Analysis**

**ALS – Lima, Peru**

ALS Lima is accredited to ISO 9001:2008 for their quality management systems and to ISO/IEC 17025:2005 for their competence of laboratory testing. This laboratory is used as a primary analytical laboratory for:

- Exploration Drilling
- Geochemical Sampling (Rocks, Soils, & Streams Sediments)

**Procedure:**

- Gold determined by 50 g fire assay with an AAS finish for drill samples\(^1\) (method code AU-AA24), and with ICP-AES\(^2\) finish for field rock samples (method code AU-ICP22). Minimum detection limit for AAS finish procedure is 0.005 g/t Au and for ICP is 0.001 g/t Au. Maximum detection limit in both cases is 10 g/t Au.
- If gold assays greater than 10 g/t is detected for either drill or field samples then over-limit re-assays are completed using a 50 g fire assay with a gravimetric finish, method code AU-GRA22. The detection range for this procedure is 0.05 g/t Au to 1,000 g/t Au.
Multi-element analysis is performed on all samples using method code ME-MS41, consisting in an aqua regia digestion and ICP-AES^2 and ICP-MS^3 finish. 51 Elements are analyzed, including gold and silver. The silver detection range for this procedure is 0.01 ppm to 100 ppm.

If silver assays greater than 100 ppm then over-limit re-assays are completed with aqua regia digestion and AAS finish (AG-AA46, detection limit 1-1,500ppm). When Cu, Pb, or Zn assays exceed 10,000 ppm re-assays are completed (Cu-AA46, 0.001-50%; Pb-AA46, 0.001-30%; Zn-AA46, 0.001-60%).

Notes:
1. AAS: Atomic absorption spectroscopy
2. ICP-AES: Inductively-coupled plasma - atomic emission spectroscopy
3. ICP-MS: Inductively-coupled plasma – mass spectrometry

Inspectorate - Lima, Peru

Inspectorate Lima is accredited to ISO 9001:2008 for its quality management system and to ISO/IEC 17025:2005 for its competence of laboratory testing. Currently this laboratory is used for QAQC check assays for gold only from pulp duplicates related to:

- Exploration Drilling
- Geochemical Sampling (Rocks)

Procedure:

- Gold determined by 50 g fire assay with an AAS^1 finish for drill samples using method code FA450-Au, which has a detection range from 0.005 g/t Au to 10 g/t Au. For surface samples fire assays are done with ICP-AES^2 finish using method code FA350-Au 50g, which has a detection range from 0.002 g/t Au to 10 g/t Au.

- If gold assays greater than 10 g/t were detected using the above technique, then over-limit re-assay using a 50 g fire assay with a gravimetric finish (method code FA550-Au). The detection range for this procedure is 0.9 g/t Au to 1,000 g/t Au.

Notes:
1. AAS: Atomic absorption spectroscopy
2. ICP-AES: Inductively-coupled plasma - atomic emission spectroscopy

Chain of Custody and Security

Once sealed, core boxes are transported from the drill site to the Las Peñas exploration camp. At the camp, core is checked by geologists and stored in the core shed during the logging and sampling process. Samples are sealed in plastic bags using single-use plastic cable-ties; the sealed sample bags are placed in plastic buckets and then stored in a locked shed until shipment. Lundin Gold personnel do not participate in any sample preparation activities beyond cutting core samples.

Once ready for shipment, a list of sample batches and included samples is sent via electronic mail to camp administration and logistics, to the sample preparation laboratory, and to camp security, before the sample batches leave camp. The Las Peñas camp has 24-hour security, which includes monitoring activities in the core shed area. Drilling samples are then transported from camp overland by a transport company truck directly to Quito where the custody of the samples is transferred to laboratory personnel. During transport camp security maintains communication with the transport company driver in order to track the progress and safety of the transport truck.
In the case of surface exploration samples (rocks and soils), these are sealed in plastic bags with single use cable-ties, packed in rice bags, and these are delivered by light truck to a transport company in the city of Loja for transport to Quito. The samples are then picked up from the transport company’s terminal in Quito by Lundin Gold personnel and delivered to the preparation laboratory.

Signatures for responsible parties are required at every step of the process and records are archived at the Las Peñas camp. When samples are received at the sample preparation laboratory, the samples are laid out on the laboratory floor and reviewed by laboratory personnel. If the samples are received in good order and consistent with the sample list of the work order, the laboratory sends by electronic mail confirmation of sample reception. If laboratory personnel observe any variations with respect to the list of samples or if there were any problems with sample integrity, Lundin Gold is advised by the laboratory by electronic mail before any further action is taken.

Once prepared the 150g pulp samples are packaged by the sample preparation laboratory for shipment to their analytical facility in Lima. Before shipment, Lundin Gold personnel inserted certified reference material (CRMs), in the sample batch at the sample preparation laboratory. In the case of pulp duplicates for outside check assays, previously these sample batches were picked up by Lundin Gold personnel and delivered to the Inspectorate sample preparation laboratory in Quito for shipment to their Lima analytical laboratory. Lundin now tasks ALS to insert the CRMs in the check assay batches and deliver these directly to Inspectorate (without any Lundin Gold intervention).

Digital laboratory assay data is distributed by electronic mail to project managers and to the resource database administrator via electronic mail. The laboratory assay data is received in 2 separate files. The first file is an electronic certificate of the sample assays in PDF format while the second is an Excel table for uploading into the database. That assay data is manually uploaded to the database where it is automatically merged with the appropriate sample data. The resource database system requires users to be logged on to the system. Each user is assigned privileges that are dependent on their duties.

**Bulk Density Measurements**

After core is sampled, intervals of solid core (10 cm to 20 cm in length) are selected for bulk density determinations. Measurements are made from every hole at an interval rate of approximately 50 m in un-mineralized intervals and every 20 m in mineralized intervals. The procedure used is the Marcy Method, where the sample is dried, weighed, waxed and then weighed in water.

**Quality Assurance and Quality Control**

Quality assurance (QA) provides evidence to demonstrate that the assay data has precision and accuracy within generally accepted limits for the sampling and analytical method(s) used in order to have confidence in a resource estimate. Quality control (QC) consists of procedures used to ensure that an adequate level of quality is maintained in the process of collecting, preparing and assaying the exploration drilling samples.

In general, QA/QC programs are designed to prevent or detect contamination and allow assaying (analytical), precision (repeatability) and accuracy to be quantified. In addition, a QA/QC program can disclose the overall sampling-assaying variability of the sampling method itself.

Lundin Gold has implemented a thorough QA/QC program, largely following previous practices by Kinross and Aurelian, which included the regular insertion of blank samples, CRMs, field and reject duplicates and check assaying from pulp duplicates. The operators perform ongoing monitoring of the program, with spurious results being investigated and changes implemented when required. Insertion rates and procedures employed by Lundin Gold are shown in the following table.
Certified Reference Material (CRM)

Results of the regular submission of certified and uncertified reference material (standards) are used to identify problems with specific sample batches and long-term biases associated with the primary assay laboratory. The FDN project site sourced certified reference material (CRM) from Rocklabs in New Zealand. New CRM materials may be sourced in the future from Rocklabs or from other recognized providers.

CRM material is included in the sample stream at a rate of 1 in 25.

CRMs submitted for a project validate the precision and accuracy of results within the grade range of interest by approximating the cut-off grade, the average grades and the high grades for the project. For FDN the gold grades of interest are approximately 3 g/t (cut-off grade), 9 g/t (average grade) and over 20 g/t (high grade). Silver grades of interest, although supplemental to gold, are from 10 g/t to 20 g/t. The ranges of expected values of the submitted CRMs for gold is from 0.819 g/t Au to 30.14 g/t Au and for silver is from 11.02 g/t to 58.38 g/t.

Control charts are prepared for each of the CRMs used on the project, and reviewed for individual laboratory bias, precision and accuracy, as well as changes and drift of assayed grades over short and long-time spans. Failure rates are defined as a gold value reporting more than three standard deviations from the expected value, or two consecutive gold values reporting more than two standard deviations from the expected values.

Blank Material

The regular submission of blank material is used to assess contamination during sample preparation and to identify sample numbering errors. Blank material is sourced from Hollin Formation sandstone.

Anomalous results are usually interpreted as contamination or a sample switch. Site operators consistently monitor the results of blank samples and follow up spurious results with respective investigations. Assay values of greater than 0.05 g/t Au for blank material are considered failures or 10 times detection limit.

Blank material is included in the sample stream at a rate of 1 in 20 (minimum) and may be increased where visible gold is observed, or very high grades are expected.

Control Sample Failures

When a control sample (CRM or Blank) fails to return the expected value an entry is made into the table of failures, the control sample as well as 10 samples previous to, and 10 samples afterward are immediately re-assayed from pulp and rejects duplicates. Based on a review of the failure and the re-assays, a description of the failure analysis is documented into the table of failures together with the actions taken (signed off by Exploration Manager), which may include substituting the initial results with re-assays. If samples adjacent to the failed control sample are non-mineralized, decision may be taken to take no further actions with approval of the Exploration Manager. When assays of duplicate samples exceed 30% variation with respect to the original sample (for samples with significant grade, the same failure methodology is followed.)
**Duplicates**

Duplicate samples help to monitor preparation and assay precision and grade variability as a function of sample homogeneity and laboratory error.

Since 2016, field duplicate samples are collected as both halves of core samples. For every 50-field/core sample, a minimum of one field duplicate is inserted in the batch. As our batches are based of 75 samples (including QC samples) 2 field duplicates are included in every full batch.

Coarse reject samples are collected as an additional split from the crushed reject material (better than 70% passing -2 mm or 10 mesh). As for field duplicates, a minimum of one field duplicate is inserted in for every 50-field/core samples.

**Check Assays**

Pulp duplicates are sent for check assays to Inspectorate Laboratory in Lima with a frequency of one pulp duplicate for every 10-field/core samples. The 150g pulp duplicate samples are split from the 300g of pulverized rock (85% passing -75 microns or 200 mesh) prepared by ALS Quito as previously described. Lundin Gold inserts a minimum of one CRM for every 25 pulp duplicates and the samples are normally sent in batches of 75 samples. Lundin Gold previously delivered these to Inspectorate offices in Quito who take responsibility of sending the samples to their Lima laboratory, but now tasks ALS to insert the CRMs in the check assay batches and deliver these directly to Inspectorate (without any Lundin Gold intervention).

**THE NEWCREST EARN-IN: SURNORTE CONCESSIONS**

In 2018, the Company entered into the Newcrest Earn-In Agreement which provides for the creation of a joint venture company to explore eight early stage concessions currently held by Lundin Gold’s subsidiary, Surnorte including: Alberto, Maicus 1 to 6 and Victoriana (the **JV Concessions**). The JV concessions are to the north and south of and a distance from Fruta del Norte and AMSA’s block of concessions surrounding the Fruta del Norte deposit (the **Central Concessions**). Under the Earn-In Agreement, Newcrest is operator and can earn up to a 50% interest in the joint venture company by spending $20 million over a five-year period.

Under the Newcrest earn-in period, the parties have also agreed to a customary area of interest restriction within 5 kms of the perimeter of the JV Concessions and the Central Concessions. Under the Newcrest Earn-In Agreement the parties have also agreed that, so long as Newcrest holds 10% or more of the issued and outstanding Shares of Lundin Gold, Lundin Gold cannot dispose of any interest in the Central Concessions without first providing Newcrest with the right to acquire such interest in the Central Concessions.

In 2019, Newcrest conducted additional mapping, sampling and validation work on the northern concessions (Alberto and Victoriana) and has planned a scout drilling program for 2020. Permits for the drilling program have been obtained.

The JV Concessions are subject to the B&A Royalty.
LUNDIN GOLD’S SECURITIES

THE SHARES

The Company is authorized to issue an unlimited number of Shares. As of December 31, 2019, Lundin Gold had an aggregate of 223,631,212 Shares issued and outstanding. As of the date of this AIF, Lundin Gold had an aggregate of 224,424,162 Shares issued and outstanding.

All of the Company’s Shares rank equally as to voting rights. Shareholders are entitled to receive notice of, and to one vote per Share at, every meeting of shareholders, to receive such dividends as the Board declares and to share equally in the assets of Lundin Gold remaining upon the liquidation, dissolution or winding up of Lundin Gold after the creditors of Lundin Gold have been satisfied and after the payment of the aggregate liquidation preference of any Preference Shares (as defined herein) then outstanding. The Shares do not carry any pre-emptive, subscription, redemption of conversion rights, nor do they contain any sinking or purchase fund provisions.

Shareholders are entitled to receive dividends if, as and when declared by the Board. The directors have adopted a policy of dedicating cash flow to reinvestment in the business of the Company. Accordingly, no dividends have been declared to date.

PREFERENCE SHARES

The Company is also authorized to issue, from time to time in one or more series, an unlimited number of preferred shares (the Preference Shares). As of December 31, 2019, and the date of this AIF, no Preference Shares have been issued.

The Preference Shares may be issued from time to time in one or more series, each consisting of a number of Preference Shares as determined by the Board which also may fix, subject to the restrictions set out below, the designations, rights, privileges, restrictions and conditions attaching to the shares of each series of Preference Shares. The Preference Shares of each series shall, with respect to payment of dividends and distribution of assets in the event of voluntary or involuntary liquidation, dissolution or winding-up of Lundin Gold rank on parity with the Preference Shares of every other series and shall be entitled to preference over the Shares and the shares of any other class ranking junior to the Preference Shares.

The Preference Shares of any series may be purchased for cancellation or made subject to redemption as determined by the Board. The holders of Preference Shares shall be entitled to notice of meetings called for the purpose of authorizing the dissolution of Lundin Gold or the sale, lease or exchange of substantially all of its assets but shall not be entitled to vote thereat, except as provided by applicable law.
PRICE RANGE AND TRADING VOLUME

Lundin Gold’s primary listing of the Shares is on the TSX, where they trade under the symbol “LUG”. The following table sets forth, for the periods indicated, the reported intra-day high and low sales prices and aggregate volume of trading of the Shares on the TSX in 2019.

PRIOR SALES

Equity Compensation Grants

At the Annual General and Special Shareholders’ Meeting held on June 3, 2019, the Omnibus Incentive Plan (the Omnibus Plan) was approved. The Omnibus Plan supplements the Company’s Amended and Restated Stock Option Plan which was approved on December 12, 2014 and subsequently amended on June 1, 2017 (the Legacy Plan). Options granted under the Legacy Plan remain outstanding and are governed by the terms of the Legacy Plan; after the Omnibus Plan’s approval in June 2019, no new options could be granted under the Legacy Plan.

A summary of the key provisions of the Omnibus Plan is available in the Management Information Circular dated April 24, 2019 which is available under the Company’s profile on SEDAR.

In 2019, the Company granted the following options pursuant to the Legacy Plan:

<table>

Warrants

The Company has an aggregate of 411,441 Warrants outstanding. Each Warrant has a term of three years from the date of issue and is exercisable for a Share upon payment of the exercise price of CAD$5.98. The details of the Warrants issuances are as follows:

- On March 29, 2019, a total of 300,000 Warrants were issued to Nemesia, along with 300,000 Shares, in lieu of fees pursuant to the COF. The weighted-average fair value of the Warrants issued to Nemesia is
CAD$1.66. Refer to Note 12 of Lundin Gold’s 2019 Financial Statements, which are available on SEDAR for more information.

- On April 3, 2019, the Company issued 111,441 Warrants to Newcrest at a price of CAD$1.66 per Warrant for total proceeds of CAD$0.2 million pursuant to its anti-dilution rights granted as part of the Private Placement on account of the issuance of Warrants to Nemesia.

## LUNDIN GOLD’S MANAGEMENT

### THE BOARD OF DIRECTORS

The following table sets out the names and the provinces or states and countries of residence of each of the directors of Lundin Gold as of the date hereof, their respective positions and offices held with Lundin Gold and their principal occupations during the five preceding years. The following table also identifies the members of each committee of the Board.

</table>

The directors and executive officers of Lundin Gold, as a group, beneficially own, or control or direct, directly or indirectly, 11,741,409 Shares, representing approximately 5.23% of the outstanding Shares as of the date of this AIF. This information was obtained from publicly disclosed information and has not been independently verified by Lundin Gold.

**CEASE TRADE ORDERS, BANKRUPTCIES, PENALTIES OR SANCTIONS**

Other than as referred to below, no director or officer of the Company:

(a) is, as at the date of this AIF, or has, within the previous ten-year period, been a director, chief executive officer, or chief financial officer of any company (including Lundin Gold) that:

(i) was subject to a cease trade or similar order or an order that denied the relevant company access to any exemption under securities legislation that was in effect for a period of more than 30 consecutive days that was issued (A) while that person was acting in such capacity or (B) after that person ceased to act in such capacity but which resulted from an event that occurred while that person was acting in that capacity; or

(ii) became bankrupt, made a proposal under any legislation relating to bankruptcy or insolvency or was subject to or instituted any proceedings, arrangement or compromise with creditors or had a receiver, receiver manager or trustee appointed to hold its assets (A) while that person was acting in such capacity or (B) within a year of that person ceasing to act in such capacity, or

(b) has, within the previous ten-year period, become bankrupt, made a proposal under any legislation relating to bankruptcy or insolvency, or become subject to or instituted any proceedings, arrangement or compromise with creditors, or had a receiver, receiver manager or trustee appointed to hold such person’s assets; or

(c) is, or has been, subject to any penalties or sanctions (i) imposed by a court relating to securities legislation or by a securities regulatory authority or has entered into a settlement agreement with a securities regulatory authority, or (ii) imposed by a court or regulatory body that would likely be considered important to a reasonable security holder in making an investment decision.

Ron Hochstein and Lukas Lundin were directors and Alessandro Bitelli was Chief Financial Officer of Sirocco Mining Inc. (Sirocco). Pursuant to a plan of arrangement completed on January 31, 2014, Canadian Lithium Corp. (CLC) acquired Sirocco. Under the plan of arrangement, CLC amalgamated with Sirocco to form RB Energy Inc. (RBI).

In October 2014, RBI commenced proceedings under the Companies’ Creditors Arrangement Act (CCAA). CCAA proceedings continued in 2015 and Duff & Phelps Canada Restructuring Inc., now KSV Advisory Inc., was appointed in May 2015 to administer and realize upon the assets of RBI. The TSX de-listed RBI’s common shares in November.
24, 2014 for failure to meet the continued listing requirements of the TSX. Since that time, RBI’s common shares have been suspended from trading.

Lukas Lundin was never a director, officer or insider of RBI. Lukas Lundin, however, was a director of Sirocco within the 12-month period prior to RBI filing under the CCAA. Ron Hochstein was a director of RBI from the time of the plan of arrangement with CLC to October 3, 2014. Alessandro Bitelli was the Chief Financial Officer of RBI from the time of the plan of arrangement with CLC until May 8, 2015.

CONFLICTS OF INTEREST

Some of Lundin Gold’s directors are also directors and officers of other natural resource companies and, consequently, there exists the possibility for such directors and officers to be in a position of conflict relating to any transactions or relationships between the Company or common third parties. Any decisions made by any of such directors and officers involving the Company are made in accordance with their duties and obligations to deal fairly and in good faith with the Company and such other companies and their obligations to act in the best interests of Lundin Gold’s shareholders. In addition, each of the directors of the Company discloses and refrains from voting on any matter in which such director may have a conflict of interest.

None of the present directors or senior officers of the Company, and no associate or affiliate of any of them, has any material interest in any transaction of the Company or in any proposed transaction which has materially affected or will materially affect the Company except as described herein.

• One of Lundin Gold’s directors, Istvan Zollei, is employed by Orion. Orion is a significant shareholder of the Company, currently holding a 10.79% interest in the Company. In addition to its interest in the Company as shareholder, Orion is a secured lender to the Company pursuant to the Orion Bx Financing. AESA has also entered into an Offtake Agreement with Orion, providing for the sale of refined gold produced from doré from FDN. See “Material Contracts” for more information about Orion’s rights under the Prepay Loan, Stream and Offtake Agreement. While the Company is not aware of a pending or existing conflict of interest with Mr. Zollei as of the date of this AIF, the interests of Orion as a significant shareholder and secured lender and its business relationship with Lundin Gold may place Mr. Zollei in a position of conflict as a director of the Company in the future.

• Two of Lundin Gold’s directors, Ms. Brown and Mr. Jones (the Newcrest Nominees) are employed by Newcrest. Newcrest is a control person and strategic investor of the Company, having acquired its 27.1% interest in the Company upon the closing of the Private Placement. At the time of this AIF, Newcrest’s interest in the Company has increased to 31.85%. Pursuant to the Newcrest Subscription Agreement, Newcrest has been granted certain rights over the direction of the Company. See “Material Contracts” for more information about Newcrest’s rights under the Newcrest Subscription Agreement. In addition, Lundin Gold and Newcrest have entered into the Earn-In Agreement on certain Lundin Gold exploration concessions. While the Company is not aware of a pending or existing conflict of interest with the Newcrest Nominees as of the date of this AIF, the interests of Newcrest as a control person and strategic investor of the Company, and its business relationship with Lundin Gold may place the Newcrest Nominees in a position of conflict as directors of the Company in the future.

INTEREST OF MANAGEMENT AND OTHERS IN MATERIAL TRANSACTIONS

Other than as disclosed in this AIF, no director or executive officer of Lundin Gold, no person or company that beneficially owns, controls or directs, indirectly or directly, more than 10% of the Shares, and no associate or affiliate of any of them, has or has had, within the three most recently completed financial years or during the current
financial year, any material interest, direct or indirect, in any transaction which materially affects or is reasonably expected to materially affect Lundin Gold, except as disclosed below.

Prior to the Private Placement, the Lundin Family Trust, through its holdings in Zebra and Lorito, was a control person of Lundin Gold. Pursuant to the Private Placement, Zebra acquired 8,083,141 Shares and Lorito acquired 3,464,203 Shares. After the completion of the Private Placement, the Lundin Family Trust owned 47,467,952 Shares, representing approximately 22.3% of the issued and outstanding Shares. The Lundin Family Trust currently holds 60,114,566 Shares, representing 26.79% of the Company.

On March 29, 2019, AESA entered into the COF pursuant to which Nemesia agreed to provide the Project with a $75 million cost overrun facility. To date, the Company has not drawn any amount under the COF. In accordance with the terms of the COF, the Company issued Nemesia 300,000 Shares and 300,000 Warrants. See “Material Contracts”. Lundin Gold is required to issue an additional 300,000 Shares to Nemesia as a condition precedent to the first utilization of the COF.

STANDING COMMITTEES OF THE BOARD

THE AUDIT COMMITTEE

The Audit Committee of the Board is principally responsible for:

- recommending to the Board the external auditor to be nominated for election by the Company’s shareholders at each annual meeting and negotiating the compensation of such external auditor;
- overseeing the work of the external auditor;
- reviewing the Company’s annual and interim financial statements, its accompanying management’s discussion and analyses in respect thereof and press releases regarding earnings before they are reviewed and approved by the Board and publicly disseminated by the Company; and
- reviewing the Company’s financial reporting procedures for the Company’s public disclosure of financial information extracted or derived from its financial statements.

The Board has adopted an audit committee mandate (the Mandate), which sets out the Audit Committee’s mandate, organization, powers and responsibilities. The complete Mandate is attached as Schedule A to this AIF.

Below are the details of each Audit Committee member, including his or her name, whether she or he is independent and financially literate as such terms are defined under National Instrument 52-110 - Audit Committees of the Canadian Securities Administrators (NI 52-110) and his or her education and experience as it relates to the performance of his or her duties as an Audit Committee member. All three audit committee members are financially literate under NI 52-110. The qualifications and independence of each member is discussed below.
<table>

</tbody>
</table>

Notes:

(1) To be considered independent, a member of the committee must not have any direct or indirect "material relationship" with Lundin Gold. A material relationship is a relationship which could, in the view of the Lundin Gold Board, reasonably interfere with the exercise of a member’s independent judgment.

(2) To be considered financially literate, a member of the committee must have the ability to read and understand a set of financial statements that present a breadth and level of complexity of accounting issues that are generally comparable to the breadth and complexity of the issues that can reasonably be expected to be raised by Lundin Gold’s financial statements.

Since the commencement of the Company’s most recently completed financial year, there has not been a recommendation of the Audit Committee to nominate or compensate an internal auditor which was not adopted by the Board.

The Audit Committee has adopted specific policies and procedures for the engagement of non-audit services as described in Section 4 of the Mandate.

The following table discloses the fees billed to the Company by its auditor, PwC, during the last two fiscal years. Services were billed and paid in Canadian dollars and have been translated into U.S. dollars using an average annual exchange rate of: $0.7718 for 2018 and $0.7536 for 2019.
### Financial Year Ending Audit Fees\(^{(1)}\)  
\begin{tabular}{|l|c|c|c|}
\hline
Ending & Fees & Fees & Fees & Fees \\
\hline
December 31, 2019 & 199,626 & 33,651 & 2,484 & 19,941 \\
\hline
\end{tabular}

**Notes:**

(1) The aggregate fees billed for audit services of the Company's consolidated financial statements. Audit Fees include an aggregate of $89,861 and $80,738 billed by PwC's office in Ecuador in 2018 and 2019, respectively.

(2) The aggregate fees billed for assurance and related services that are reasonably related to the performance of the audit or review of the Company's financial statements and are not disclosed in the Audit Fees column. Fees relate to reviews of interim consolidated financial statements and specified audit procedures not included as part of the audit of the consolidated financial statements.

(3) The aggregate fees billed for tax compliance, tax advice, and tax planning services.

(4) The aggregate fees billed for professional services other than those listed in the other three columns. For 2018 and 2019, “All Other Fees” relates to fees billed for specified audit procedures relating to the Private Placement and the 2019 Equity Financing, respectively.

### OTHER BOARD COMMITTEES

The Board currently has four other standing committees in addition to the Audit Committee, namely the Corporate Governance and Nominating Committee, the Compensation Committee the Environment, Health and Safety Committee and the Technical Committee (formerly, Project Advisory Committee). Each standing committee of the Board operates according to its mandate, which is approved by the Board and sets out the committee’s duties and responsibilities. A discussion of each committee and its composition can be found in the most recent management information circular prepared in connection with the Company’s Shareholder meeting.

### CORPORATE GOVERNANCE

As a Canadian reporting issuer with its Shares listed on the TSX, Lundin Gold has in place a system of corporate governance practices which is responsive to applicable Canadian requirements, including National Policy 58-201 — Corporate Governance Guidelines of the Canadian Securities Administrators (the *Guidelines*). Reference is made to the Corporate Governance Practices section of the most recent management information circular prepared in connection with the Company’s Shareholder meeting, which contains a description of the Company’s system of corporate governance practices with reference to the Guidelines.

### LEGAL AND REGULATORY PROCEEDINGS

To the Company’s knowledge, the Company is not and was not, during the year ended December 31, 2019, a party to any legal proceedings which may be material to the Company, nor is any of its property, nor was any of its property during the year ended December 31, 2019, the subject of any such legal proceedings. As at the date hereof, no such legal proceedings are known to be contemplated.

There are no: (a) penalties or sanctions imposed against Lundin Gold by a court relating to securities legislation or by a securities regulatory authority; (b) other penalties or sanctions imposed by a court or regulatory body against Lundin Gold that would likely be considered important to a reasonable investor in making an investment decision in Lundin Gold; or (c) settlement agreements Lundin Gold entered into before a court relating to securities legislation or with a securities regulatory authority.
MATERIAL CONTRACTS

Reference is made to the material contracts that have been filed by Lundin Gold with the Canadian securities regulatory authorities on SEDAR.

Below are the particulars of each contract, other than those entered into in the ordinary course of business, that is material to Lundin Gold and that was entered into during the financial year ended December 31, 2019 or was entered into before those dates but is still in effect.

The EA, combined with existing laws and regulations, establishes the fiscal, operational and commercial terms and conditions for the development of FDN. The key terms of the EA are as follows:

- Through its wholly owned subsidiary in Ecuador, Lundin Gold has negotiated the right to develop and produce gold from the Fruta del Norte Project for 25 years, which may be renewed.
- The Company and the GOE agreed to an advance royalty payment of $65 million.
- Lundin Gold agreed to pay the GOE a royalty equal to 5% of net smelter revenues from production. The advance royalty payment is deductible against royalties payable. It is deductible against the lesser of 50% of the actual future royalties payable in a six-month period or 10% of the total advance royalty payment.
- The GOE’s share of cumulative benefits derived from the Fruta del Norte Project will not be less than 50% (the Sovereign Adjustment). To the extent that the GOE’s cumulative benefit falls below 50%, the Company will be required to pay an annual sovereign adjustment. Each year, the benefits to the Company will be calculated as the net present value of the actual cumulative free cash flows of the Fruta del Norte Project from its inception. The GOE’s benefit will be calculated as the present value of cumulative sum of taxes paid including corporate income taxes, royalties, labour profit sharing paid to the State, non-recoverable VAT, and any previous sovereign adjustment payments.
- A commitment from the GOE to take measures to compensate the Company in the event of economic imbalance resulting from changes in certain taxes, laws and regulations as prescribed under EA.
- The EA also established a Windfall Tax; the Windfall Tax was, however, eliminated through tax reforms in 2018.

2. Investment Protection Agreement between the GOE and AESA, with respect to the Development of the Fruta del Norte Project dated December 19, 2016.

The IPA provides further legal and tax stability for the Company, in conjunction with the EA and existing laws in Ecuador. The key terms of the EA are as follows:

- Income tax rate fixed at 22%.
- Exemption from the capital outflow tax of 5% on payments of principal and interest to financial institutions outside of Ecuador.
- The ability to obtain benefits granted by the GOE through future investment protection agreements with other investors in similar projects in Ecuador.
- No restrictions to transfer or assign all or part of the investment, including the right to assign its rights to any financing parties.
- Other benefits granted to the Company include no restriction to:
3. Gold Prepay Credit Agreement dated as of May 30, 2017, as amended December 4, 2017, March 26, 2018, July 6, 2018 and December 23, 2019, among AESA, as borrower, Orion, in its capacity as administrative agent (the Administrative Agent) and the lenders party thereto from time to time, with respect to the provision of a secured loan facility in the amount of $150 million.

Pursuant to the Prepay Loan, the lenders have made available to AESA a non-revolving term facility in the amount of $150 million to be used exclusively for Fruta del Norte Project costs (except for amounts required to repay the 2017 Facility). Under the Prepay Loan, AESA must repay quarterly the cash equivalent of 11,500 gold ounces based on spot price at time of payment, with the initial repayment commencing on December 31, 2020. If AESA elects to defer repayment to the earlier of the commercial production date and December 31, 2021, AESA must repay quarterly the cash equivalent of 11,500 gold ounces plus an amount equal to 250 ounces times the number of quarters deferred. The Prepay Loan was amended in July 6, 2018 so that AESA could elect individual deferrals of up to four quarters.

Pursuant to the July 6, 2018 amendment to the Prepay Loan, AESA is permitted to avoid default by repaying amounts to Orion and Blackstone with an issuance of Shares at prescribed discounts to then then trading market price for up to three non-consecutive quarterly repayments. Re-borrowing repaid amounts is not permitted under the Prepay Loan.

As security, AESA has granted over all of its property. The agreement contains customary representations and warranties of AESA as well as a suite of positive covenants, negative covenants, reporting requirements and events of default. Of note, AESA is restricted (except as expressly permitted) from (i) any direct or indirect change its ownership, (ii) disposing of its assets or Project property, (iii) paying royalty payments except as permitted, (iv) encumbering its property, (v) paying dividends until six months after the commercial production date or (vi) taking actions that would make it impractical for AESA to deliver gold as required by the Offtake Agreement (discussed below).

The Prepay Loan includes customary events of default. The occurrence and continuance of an event of default may (at the discretion of the majority lenders, being more than 50%) result in an acceleration of the debt and the enforcement of the secured collateral.

4. Stream Credit Facility Agreement dated as of May 30, 2017, as amended December 4, 2017, March 26, 2018, July 6, 2018 and December 23, 2019 among AESA, as borrower, the Administrative Agent, and the lenders party thereto from time to time, with respect to the provision of a secured loan facility in the amount of $150 million.

Pursuant to the Stream Loan, the lenders have made available to AESA a non-revolving term facility in the amount of $150 million, to be used exclusively for Fruta del Norte Project costs. The terms of the Stream Loan are substantially the same as the Prepay Loan, except for the repayment terms.

The Stream Loan is repayable in variable monthly instalments equivalent to the value of 7.75% of gold production less $400 per oz. (the Gold Base Price) and 100% of the silver production less $4 per oz. (the Silver Base Price) upon the start of commercial production at the Fruta del Norte Project, up to a maximum of 350,000 oz. of gold and six million oz. of silver. The Gold Base Price and Silver Base Price will increase by 1% per annum starting on the third anniversary of the commercial production date. In addition, the Company has the option to repay (i) 50% of the remaining Stream Loan on June 30, 2024 for $150 million and / or (ii) the other 50% of the remaining Stream Loan on June 30, 2026 for $225 million.
5. Offtake Agreement dated as of May 30, 2017 among AESA and Orion, Gryphus Pte Ltd., an affiliate of Blackstone, and the purchasers thereunder from time to time, whereby Orion and Blackstone have been granted the right to purchase 50% of Fruta del Norte gold production, up to a maximum of 2,500,000 ounces.

Pursuant to the Offtake Agreement, AESA agreed to sell to the purchasers, and the Purchasers have agreed to purchase from AESA, 50% of Refined Gold produced from FDN to a maximum of 2,500,000 ounces. Each of Orion and Blackstone have agreed to purchase 50% of the Refined Gold produced from doré and take a cash payment from AESA as a settlement amount where there is a delivery shortfall, until an aggregate of 2,500,000 ounces of Refined Gold has been delivered or settled pursuant to the agreement.

6. Guaranty dated as of May 30, 2017, as amended on May 16, 2018, July 6, 2018 and March 29, 2019, among Lundin Gold Inc., AurelianEcuador Holding S.A., Ecoaurelian Agrícola S.A., Aurelian Resources Inc. and Aurelian Resources Corporation Ltd. (collectively, the Guarantors), and The Bank of Nova Scotia, in its capacity as Offshore Collateral Agent, and, as of March 29, 2019, Condor Finance Corp. as an additional Guarantor, with respect to the guarantee the obligations of AESA in connection with the Financing.

Pursuant to the Guaranty, the Guarantors have guaranteed for the benefit of the lenders the obligations of AESA in connection with the Financing, including all obligations under the Prepay Loan and the Stream Loan, as well as the obligations of each other guarantor under the Guaranty. Any future direct or indirect subsidiaries of Lundin Gold with a direct or indirect interest in the Project is required to provide such guarantee.

The Guaranty is joint and several and unlimited in recourse except in respect of Lundin Gold, against whom the Guaranty is limited in recourse automatically after the later of Project completion or commercial production. The other guarantors will remain as guarantors with full recourse until the guaranteed obligations have extinguished or the guarantors have been released.

The Guaranty sets forth customary covenants. Each of the guarantors (other than Lundin Gold) under the Guaranty has provided security over all of their assets, and both Lundin Gold and Aurelian Resources Inc. have pledged their interests in the shareholdings of Aurelian Resources Inc. and Aurelian Resources Corporation Ltd. respectively.

7. Subscription Agreement between Lundin Gold and Newcrest dated February 24, 2018 with respect to the Private Placement (the Newcrest Subscription Agreement).

Pursuant to the Newcrest Subscription Agreement, Newcrest subscribed for 57,736,721 Shares at a price of $4.33 per share in cash for an aggregate subscription price of $250 million. Using an exchange rate of CAD$1.00=US$0.7868, this represents an aggregate subscription price of CAD$317.7 million (or CAD$5.50 per Share).

Pursuant to, and subject to the terms and conditions of, the Newcrest Subscription Agreement, Newcrest has been granted certain rights by Lundin Gold including, but not limited to, the following:

i. For so long as Newcrest continues to hold at least 20% of the issued and outstanding Shares, Newcrest will be entitled to nominate two directors to the Board and will be entitled to nominate one director to the Board for so long as Newcrest holds between 10% and 20% of the issued and outstanding Shares.

ii. For so long as Newcrest continues to hold at least 10% of the issued and outstanding Shares, Newcrest will have certain anti-dilution rights and will also be entitled to exercise pre-emptive rights with respect to future equity financings and in respect of non-cash issuances of Shares (other than certain significant transactions) in order to permit Newcrest to maintain its percentage ownership interest in Lundin Gold.
iii. For so long as Newcrest continues to hold at least 15% of the issued and outstanding Shares, Newcrest will have customary piggyback registration rights from and after December 31, 2021 (or earlier upon the occurrence of certain events).

iv. For so long as Newcrest continues to hold at least 15% of the issued and outstanding Shares, Lundin Gold will not be permitted to take certain actions without the prior approval of Newcrest, including with respect to:
   a. the issuance of any preferred shares, the creation of any new shares or the amendment to the terms of the Shares of Lundin Gold;
   b. share transfers or issuances by any of Lundin Gold’s material subsidiaries; and
   c. joint ventures, co-ownership or similar arrangements in respect of the Fruta del Norte Project;
   d. subject to certain exceptions, commodity-based financings with respect to the Fruta del Norte Project.

v. Newcrest has agreed to certain restrictions on buying securities of the Company beyond a 32% ownership in Lundin Gold for a period of eight years. The standstill obligation falls away in certain situations including but not limited to: a takeover bid for Lundin Gold by a third party or Newcrest; a significant M&A transaction not supported by Newcrest; certain significant changes in ownership of the Lundin Family Trust in Lundin Gold; and Lundin Gold defaulting on its financing agreements.

8. Subscription Agreement between Lundin Gold and Orion dated February 24, 2018 with respect to the Private Placement (the Orion Subscription Agreement).

Pursuant to the Orion Subscription Agreement, Orion subscribed for 24,213,075 Shares at a price of $4.13 per share in cash for an aggregate subscription price of $100 million. Using an exchange rate of CAD$1.00=US$0.7868, this represents an aggregate subscription price of CAD$127.1 million (or CAD$5.25 per Share).

Pursuant to, and subject to the terms and conditions of, the Orion Subscription Agreement, Orion has been granted certain rights by Lundin Gold including, but not limited to, the following:

i. For so long as Orion continues to hold at least 10% of the issued and outstanding Shares, Orion will be entitled to nominate one director to the Board.

ii. For so long as Orion continues to hold at least 10% of the issued and outstanding Shares, Orion will have certain anti-dilution rights and will also be entitled to exercise pre-emptive rights with respect to future equity financings and in respect of non-cash issuances of Shares (other than certain significant transactions) in order to permit Orion to maintain its percentage ownership interest in Lundin Gold.

9. Common Terms Agreement dated July 6, 2018 among AESA (as Borrower), arranged by the Bank of Nova Scotia, Caterpillar Financial Services Limited, ING Capital LLC, KFW IPEX-Bank GMBH, Natixis New York Branch, and SG Americas Securities LLC (as Mandated Lead Arrangers), ING Capital LLC, SG Americas Securities, LLC, the Bank of Nova Scotia, KFW IPEX-Bank GMBH (as Bookrunners) and the Bank of Nova Scotia (as Administrative Agent and Intercreditor Agent), as amended March 29, 2019 and December 23, 2019, with respect to the provision of a secured loan facility in the amount of $350 million.

Under the Common Terms Agreement (the CTA), the Senior Lenders have agreed to make available to AESA two term loan facilities in the aggregate amount of $350 million. The CTA sets out those terms (including definitions, repayments and prepayments, interest and fees, tax matters, security provisions, covenants, conditions precedent, events of default, payment mechanics, and other common terms) applicable to the mechanics, administration and management of the senior financing arrangements which are common to each of the two facility agreements.

AESA is required to make certain mandatory repayments and prepayments. Payments must be made in accordance with the two facility agreements, the CTA, a collateral agency, accounts and security agreement
(CAASA) and the intercreditor agreement. Certain proceeds to AESA will also trigger the CTA’s mandatory prepayment provisions. In addition, AESA is required to make regular cash sweeps from excess cash.

Subject to certain conditions, the Borrower may voluntarily prepay all or a portion of the loans under either of the facility agreements. Reborrowing repaid amounts is not permitted.

Interest is calculated and payable in accordance with each facility agreement. The CTA provides for the conditions which trigger the accrual and payment of default interest.

The CTA sets forth the security arrangements required to be granted by the Borrower and guarantors. The scope of the security package is substantially the same as that granted in the Orion Bx Financing and includes security over all of the collateral of AESA and the guarantors (other than Lundin Gold): (i) a Canadian security package consisting of, among others, a general security agreement, pledges over certain shares of Aurelian Resources Inc. and Aurelian Resources Corporation Ltd., and blocked accounts agreements; (ii) an Ecuadorian security consisting of, among others, a commercial (i.e. intellectual property) pledge agreement, an industrial (i.e. equipment and other personal property) pledge agreement, a mortgage, certain guaranty trust agreements, and certain fiduciary mandates; (iii) the CAASA; and (iv) the intercreditor agreement, among others.

The Senior Lenders will have priority over the pre-existing security package of Orion and Blackstone. In addition, the Senior Lenders will benefit from security over the debt service reserve accounts or other such arrangements.

The CTA sets forth customary affirmative covenants and negative covenants (including financial, Project, notification and reporting requirements).

The CTA sets forth customary events of default. Following the expiration of any cure or grace periods following such Event of Default, Senior Lenders are, subject to the terms of the intercreditor agreement, entitled to take enforcement action. Such enforcement action includes drawstop, the blocking of the project accounts, acceleration of the senior facilities and realization of the security arrangements.

10. Completion Agreement dated July 6, 2018, among Lundin Gold, Aurelian Resources Inc., Aurelian Resources Corporation Ltd., Aurelian Ecuador Holding S.A., Ecauerial Agrícola S.A. (as Completion Guarantors), and Caterpillar Financial Services Limited (as Mandated Lead Arranger, ECA Agent and Senior Lender), KFW IPEX Bank GMBH (as Mandated Lead Arranger, ECA Agent and Senior Lender), SG Americas Securities, LLC (as Mandated Lead Arranger and Bookrunner), Societe Generale (as Document Agent, Environmental and Social Agent and Senior Lender), The Bank of Nova Scotia (as Mandated Lead Arranger, Administrative Agent, Intercreditor Agent, Commercial Facility Agent, ECA Facility Agent, Offshore Collateral Agent and Senior Lender), Natixis New York Branch (as Mandated Lead Arranger and Senior Lender) and Bank of Montreal (as Senior Lender) and, as of March 29, 2019, Condor Finance Corp., as an additional Completion Guarantor.

Pursuant to the Completion Agreement, the Completion Guarantors have provided a limited guarantee of AESA’s obligations under the facility agreements comprised in the Senior Facility, which guarantee remains in force until Project Completion. Project Completion is defined to occur when AESA has passed a detailed completion test, which occurs over a period of time, details the physical assets that must be in place and operating as intended and sets a threshold for operating performance. The Completion Agreement includes representations and covenants customary to guarantee agreements.

11. Underwriting Agreement dated February 20, 2019 between the Company and GMP Securities L.P. and BMO Capital Markets, on behalf of a syndicate of underwriters (the Underwriters).
Pursuant to the Underwriting Agreement, the Underwriters purchased an aggregate of 8,625,000 Shares at a price of CAD$5.40 per Share for gross proceeds to the Company of CAD$46,575,000. The Underwriting Agreement provides that the net proceeds from the 2019 Equity Financing will be used to fund exploration on Lundin Gold’s extensive portfolio of mineral concessions in Ecuador and for general corporate purposes.

12. Nemesia Facility Agreement (referred to in this AIF as the COF) dated March 29, 2019 between Condor Finance Corp. (Condor), Lundin Gold, Aurelian Resources Inc. and Aurelian Resources Corporation Ltd. and Nemesia S.à.r.l. (the COF Lender).

Pursuant to the COF, the COF Lender has agreed to make available to Condor a cost overrun facility in the aggregate amount of $75 million. The COF is available once the Senior Facility is fully drawn and can only be used to fund a potential cost overrun related to the development of the Project. The COF is only available to be drawn until Completion Date, as defined in the CTA. To date, the Company has not drawn any amounts under the COF. The COF has no fixed maturity date.

In accordance with the terms of the COF, the Company issued Nemesia 300,000 Shares and 300,000 Warrants in lieu of fees. Lundin Gold is required to issue an additional 300,000 Shares to Nemesia as a condition precedent to the first utilization of the COF. In the event of a cash shortfall, the COF Lender may elect to settle amounts owed in the Company’s Shares or to defer payment of amounts owed.

The COF has been secured through a subordinated pledge of Condor’s shares and the shares of Aurelian Resources Inc. and Aurelian Resources Corporation Ltd., which security ranks junior to that of the Senior Lenders and the lenders under the Prepay and Stream Loans.

Condor has entered into a mirror loan facility with its affiliate, AESA, pursuant to which proceeds from the COF will be made available to the Project on substantially the same terms.

NAMES AND INTERESTS OF EXPERTS

The Company’s independent auditor is PricewaterhouseCoopers LLP (PwC), Chartered Professional Accountants, who have issued an independent auditor’s report dated February 19, 2019, in respect of Lundin Gold’s consolidated financial statements as at December 31, 2019 and 2018 and for the years then ended. PwC has advised that it is independent with respect to the Company within the meaning of the Chartered Professional Accountants of British Columbia Code of Professional Conduct.

Ron F. Hochstein, P. Eng., Lundin Gold’s President and Chief Executive Officer and Director, is a "Qualified Person" within the meaning of this term in NI 43-101 and has reviewed and approved sections of this AIF that are of a scientific or technical nature pertaining to the Company’s Fruta del Norte Project and has verified the data disclosed herein. To the knowledge of Lundin Gold, Ron Hochstein is the registered or beneficial owner, directly or indirectly, of less than one percent of the outstanding Shares.

Stephen Leary, MAusIMM CP(Geo), a consultant to the Company, is a "Qualified Person" within the meaning of this term in NI 43-101 and has prepared, reviewed and approved sections of this AIF that are of a scientific or technical nature and has verified the data disclosed therein. 1. **Purpose of the Audit Committee**
The Audit Committee oversees the accounting and financial reporting processes of the Corporation and its subsidiaries and all audits and external reviews of the financial statements of the Corporation on behalf of the Board, and has general responsibility for oversight of internal controls, accounting and auditing activities of the Corporation and its subsidiaries.

2. **Members of the Audit Committee**
2.1. The Audit Committee shall be appointed annually by the Board and shall be composed of three members, each of whom must be a director of the Corporation.

2.2. Each member of the Audit Committee shall hold office as such until the next annual meeting of shareholders after his or her appointment, provided that any member of the Audit Committee may be removed or replaced at any time by the Board and shall at any time cease to be a member of the Audit Committee on ceasing to be a director.

2.3. From this date forward, every Audit Committee member must be independent, within the meaning of National Instrument 52-110 (NI 52-110).

2.4. Every Audit Committee member must be financially literate, within the meaning of NI 52-110.

3. **Meeting Requirements**
3.1. The times of and the places where meetings of the Audit Committee will be held and the calling of and the procedure at those meetings shall be determined from time to time by the Audit Committee, but in any event, the Audit Committee will meet on a regular basis at least once every quarter; provided that notice of every such meeting shall be given to the Auditor (as defined in paragraph 4.1.1 below) of the Corporation and that meetings shall be convened whenever requested by the Auditor or any member of the Audit Committee in accordance with the Canada Business Corporations Act.

3.2. Two members of the Audit Committee shall constitute a quorum.

4. **Duties and Responsibilities**
4.1. **Appointment, Oversight and Compensation of Auditor**
4.1.1. The Audit Committee shall recommend to the Board:
   a) the auditor (the Auditor) to be nominated for the purpose of preparing or issuing an auditor’s report or performing other audit, review or attest services for the Corporation; and
   b) the compensation of the Auditor.
   In making such recommendations, the Audit Committee shall evaluate the Auditor’s performance and review the Auditor’s fees for the preceding year.

4.1.2. The Auditor shall report directly to the Audit Committee.

4.1.3. The Audit Committee shall be directly responsible for overseeing the work of the Auditor, including the resolution of disagreements between management and the Auditor regarding financial reporting.
4.1.4. The Audit Committee shall review information, including written statements from the Auditor, concerning any relationships between the Auditor and the Corporation or any other relationships that may adversely affect the independence of the Auditor and assess the independence of the Auditor.

4.2. Non-Audit Services

4.2.1. All auditing services and non-audit services provided to the Corporation or the Corporation’s subsidiaries by the Auditor shall, to the extent and in the manner required by applicable law or regulation, be pre-approved by the Audit Committee. In no circumstances shall the Auditor provide any non-audit services to the Corporation that are prohibited by applicable law or regulation.

4.3. Review of Financial Statements etc.

4.3.1. The Audit Committee shall review the Corporation’s:
   a) interim and annual financial statements and Management’s Discussion and Analysis (MD&A), intended for circulation among shareholders; and
   b) Annual Information Form only to the extent that it contains financial information or projections, and shall report on them to the Board.

4.3.2. The Audit Committee shall satisfy itself that the audited financial statements and interim financial statements present fairly the financial position and results of operations in accordance with generally accepted accounting principles and that the auditors have no reservations about such statements.

4.3.3. The Audit Committee shall review changes in the accounting policies of the Corporation and accounting and financial reporting proposals that are provided by the Auditor that may have a significant impact on the Corporation’s financial reports, and report on them to the Board.

4.4.1. The Audit Committee shall review the Corporation’s annual and interim press releases relating to financial results and any earnings guidance (provided by the Corporation) before the Corporation publicly discloses this information.

4.4.2. The Audit Committee must be satisfied that adequate procedures are in place for the review of the Corporation’s public disclosure of financial information extracted or derived from the Corporation’s financial statements, other than the public disclosure referred to in subsection 4.4.1, and must periodically assess the adequacy of those procedures.

4.5. Review of Annual Audit

4.5.1. The Audit Committee shall review the nature and scope of the annual audit, and the results of the annual audit examination by the Auditor, including any reports of the Auditor prepared in connection with the annual audit.

4.5.2. The Audit Committee shall satisfy itself that there are no unresolved issues between management and the Auditor that could affect the audited financial statements.

4.5.3. The Audit Committee shall satisfy itself that, where there are unsettled issues that do not affect the audited financial statements (e.g. disagreements regarding correction of internal control weaknesses, or the application of accounting principles to proposed transactions), there is an agreed course of action leading to the resolution of these matters.

4.5.4. The Audit Committee shall satisfy itself that there is generally a good working relationship between management and the Auditor.
4.6. **Review of Quarterly Review Engagements**

4.6.1. The Audit Committee shall review the nature and scope of any review engagements for interim financial statements, and the results of such review engagements by the Auditor, including any reports of the Auditor prepared in connection with such review engagements.

4.6.2. The Audit Committee shall satisfy itself that there are no unresolved issues between management and the Auditor that could affect any interim financial statements.

4.6.3. The Audit Committee shall satisfy itself that, where there are unsettled issues that do not affect any interim financial statements (e.g. disagreements regarding correction of internal control weaknesses, or the application of accounting principles to proposed transactions), there is an agreed course of action leading to the resolution of these matters.

4.7. **Internal Controls**

4.7.1. The Audit Committee shall have responsibility for oversight of management reporting and internal control for the Corporation and its subsidiaries.

4.7.2. The Audit Committee shall satisfy itself that there are adequate procedures for review of interim statements and other financial information prior to distribution to shareholders.

4.8. **Complaints and Concerns**

4.8.1. The Audit Committee shall establish procedures for:

   a) the receipt, retention and treatment of complaints received by the Corporation regarding accounting, internal accounting controls, or auditing matters; and

   b) the confidential, anonymous submission by employees of the Corporation of concerns regarding questionable accounting or auditing matters.

4.9. **Hiring Practices**

4.9.1. The Audit Committee shall review and approve the Corporation’s hiring policies regarding partners, employees and former partners and employees of the present and former Auditors of the Corporation.

4.10. **Other Matters**

4.10.1. The Audit Committee shall be responsible for oversight of the effectiveness of management’s interaction with and responsiveness to the Board;

4.10.2. The Audit Committee shall review and monitor all related party transactions which may be entered into by the Corporation.

4.10.3. The Audit Committee shall approve, or disapprove, material contracts where the Board determines it has a conflict.

4.10.4. The Audit Committee shall satisfy itself that management has put into place procedures that facilitate compliance with the provisions of applicable securities laws and regulations relating to insider trading, continuous disclosure and financial reporting.

4.10.5. The Audit Committee shall oversee and annually review the Corporation’s Code of Business Conduct and Ethics, and review and recommend to the Board the members of the Disclosure Committee from time to time and where a vacancy occurs at any time in the membership of the Disclosure Committee.

4.10.6. The Audit Committee shall periodically review the adequacy of this Charter and recommend any changes to the Board.
4.10.7. The Board may refer to the Audit Committee such matters and questions relating to the financial position of the Corporation and its affiliates as the Board from time to time may see fit.

5. Rights and Authority of the Audit Committee and the Members Thereof

5.1. The Audit Committee has the authority:
   a) To engage independent counsel and other advisors as it determines necessary to carry out its duties;
   b) To set and require the Corporation to pay the compensation for any advisors employed by the Audit Committee; and
   c) To communicate directly with the Auditor and, if applicable, the Corporation’s internal auditor.

5.2. The members of the Audit Committee shall have the right, for the purpose of performing their duties, to inspect all the books and records of the Corporation and its affiliates and to discuss those accounts and records and any matters relating to the financial position of the Corporation with the officers and Auditor of the Corporation and its affiliates, and any member of the Audit Committee may require the Auditor to attend any or every meeting of the Audit Committee.

6. Miscellaneous

Nothing contained in this Charter is intended to extend applicable standards of liability under statutory or regulatory requirements for the directors of the Corporation or members of the Audit Committee. The purposes, responsibilities, duties and authorities outlined in this Charter are meant to serve as guidelines rather than as inflexible rules and the Committee is encouraged to adopt such additional procedures and standards as it deems necessary from time to time to fulfill its responsibilities.
